Is this sufficient to explain the character of experience, and the differences between experiencing things to be a certain way and merely believing or thinking them to be that way? Many philosophers have thought not. They have insisted that there must be some form of non-representational quality to experience in addition to any representational content it may have (see QUALIA). The issue here returns us to the first part of the transparency objection to sense-datum theories: it is an open question whether there are evidently subjective, or qualitative aspects of experience other than how the world is presented to us. If one accepts that there are, then there is more agreement than one might initially have supposed between traditional sense-datum theories, which supplement awareness of sense-data with interpretation, and alternatively intentional theories, which supplement representational content with subjective qualities.

4 Naïve realism and disjunctive theories of appearance

Sense-datum theories of perception appeal to illusions and hallucinations in arguing for the existence of inner objects of perception, and

intentional theories of perception appeal to illusions to justify the view that experience is representational. But there is a strand of philosophical criticism which denies that one can draw any conclusion about perception from cases of illusion and hallucination. One motive for such criticism is an endorsement of a certain kind of naïve, or direct, realism concerning perception.

Defenders of sense-datum theories claim that the best account of experience commits one to thinking that one can sense a quality only if there actually is an instance of that quality which one senses – the argument from illusion then leads them to suppose that such qualities must be mind-dependent; defenders of intentional theories claim that the best account of experience commits one to thinking that experience is directed at, or of, mind-independent objects – the example of illusion leads them to claim that one's experience merely represents these things. A naïve realist might endorse both the initial claim of the sense-datum theorist and that of the intentional theorist, while trying to resist their conclusions: on this view, when one perceives, one is aware of some mind-independent objects and their features, and such objects and features must actually be there for one to have such an experience. This cannot be true of cases where there is no appropriate physical object of perception, as in hallucination, so the naïve realist must claim that the account applies only to cases of perception. Hence they must deny that the state of mind one is in when one perceives something is of a sort which could have occurred even were one having an illusion or hallucination. They must claim that when it appears to one as if there is a red patch there, then either there is a red patch which is apparent to one, or it is merely as if there were such a red patch apparent to one: nothing more need be in common between the situations, such as an inner object of which one is aware, or a representational content. The view, which we can call a disjunctive theory of appearances, claims that perceptual experience does not form a common kind of state across perception, illusion and hallucination.

The view has been thought objectionable for a number of reasons. First, as all sides agree, for any perception one has, one could have a matching illusion or hallucination which one could not distinguish from the perception. According to the disjunctive view, there is a genuine difference here, but how can there be a difference in the conscious state of mind which the subject is unable to detect? The disjunctive view is committed to claiming that we can be misled about the kind of conscious state we are in; indeed one might sum up the view as claiming that illusions and hallucinations mislead one not only about objects in the world, but about themselves as well.

Second, the same brain activity as can bring about perceptions can bring about hallucinations. Furthermore, any physical outcome a case of perceiving can produce, for example kicking a ball, could equally well be caused by a matching hallucination. So the disjunctive view must claim that there is a real difference between experience which is a perceiving and one which is a hallucination even though there is no causal difference between them. But many philosophers claim that there can only be a real difference between things where they differ in their causal powers. It remains a matter of dispute whether the consequences of the view are unacceptable or the objections without answer – a similar set of arguments attends debates about the nature of content and thought (see Content: wide and narrow).

PERFORMATIVES

There are certain things one can do just by saying what one is doing. This is possible if one uses a verb that names the very sort of act one is performing. Thus one can thank someone by saying 'Thank you', fire someone by saying 'You're fired' and apologize by saying 'I apologize'. These are examples of 'explicit performative utterances', statements in form but not in fact. Or so thought their discoverer, J.L. Austin, who contrasted them with 'constatives'. Their distinctive self-referential character might suggest that their force requires special explanation, but it is arguable that

performativity can be explained by the general theory of speech acts.

PERSONAL IDENTITY

Introduction

What is it to be the same person today as one was in the past, or will be in the future? How are we to describe cases in which (as we might put it) one person becomes two? What, if anything, do the answers to such questions show about the rationality of the importance we attach to personal identity? Is identity really the justifier of the special concern which we have for ourselves in the future? These are the concerns discussed here.

In order to answer the question about the persistence-conditions of persons we must indulge in some thought experiments. Only thus can we tease apart the strands that compose our concept of personal identity, and thereby come to appreciate the relative importance of each strand. There are plausible arguments against attempts to see the relation of personal identity as constitutively determined by the physical relations of same body, or same brain. I can survive with a new body, and a new brain. But it does not follow; nor is it true, that a person's identity over time can be analysed exclusively in terms of psychological relations (relations of memory, belief, character, and so on). To the contrary, the most plausible view appears to be a mixed view, according to which personal identity has to be understood in terms of both physical and psychological relations. This is the view which can be extracted from our core (that is, minimally controversial) set of common-sense beliefs about personal identity.

The possibility of the fission of persons – the possibility that, for example, a person's brain hemispheres might be divided and transplanted into two new bodies – shows that the mixed view has to incorporate a non-branching or uniqueness clause in its analysis. The concept of personal identity, contrary to what we might first be inclined to believe, is an extrinsic concept (that is, whether a given person exists can depend upon the existence of another, causally unrelated, person).

Some philosophers have recently tried to forge an important connection between theories of personal identity and value theory (ethics and rationality). The possibility of such a connection had not previously been investigated in any detail. It has been argued that, on the correct theory of personal identity, it is not identity that matters but the preservation of psychological relations such as memory and character. These relations can hold between one earlier person and two or more later persons. They can also hold to varying degrees (for example, I can acquire a more or less different character over a period of years). This view of what matters has implications for certain theories of punishment. A now reformed criminal may deserve less or no punishment for the crimes of their earlier criminal self. Discussions of personal identity have also provided a new perspective on the debate between utilitarianism and its critics.

1 Criteria of personal identity

What is it to be a person? What is it for a person at one time to be identical to some person at a later time? Although the two questions are obviously related, my concern in this entry will be with the second question. (For more on the first question, see Persons; Mind, bundle theory of.) However, I assume this much about what it is to be a person: a person is a rational and self-conscious being, with a (more or less) unified mental life. There are indeed cases (multiple personality, split-brain patients, and so on) in which the apparent lack of mental unity casts doubt on whether a single person occupies a given body. But such cases are exceptional. A normal person is a mentally unified individual. The central question of personal identity is the question of what distinguishes the sorts of changes we mentally unified individuals can survive from the sorts of changes which constitute our death.

On one very familiar view (associated with Plato, Descartes and the Christian tradition) a person can survive bodily death. Bodily death is not the sort of change which constitutes personal death. On this view, a person is an immaterial (that is, non-spatial) soul, only contingently attached to a physical body (see Soul, nature and immortality of the). This view has few philosophical adherents today. It is fraught with metaphysical and epistemological

difficulties. (For example: how can an immaterial soul interact with the material world? How can I know that you have a soul?) In what follows I simply assume, without further argument, that our continued existence is not the continued existence of an immaterial soul.

I do not have to deny that in some possible worlds, there are persons who are immaterial souls; but ours is not such a world. And our concern here is with the conditions for the identity over time of actual (human) persons. Once we have given up the immaterialist view of ourselves, we can say the following. A person is a psychophysical entity, which is essentially physically embodied. That is, a person (a typical adult human, for example) consists of a biological organism (a human body), with a control centre (the brain) that supports their mental life. Persons are essentially mental, and essentially physically embodied. But this is not the end of puzzles about personal identity; it is just the beginning.

When we judge that a friend before us now is identical to the friend we saw yesterday, we typically make this judgment of personal identity under optimal conditions. In such a case, our friend today is physically continuous with our friend yesterday (they possess the very same brain and body). And our friend today is also psychologically continuous with our friend yesterday (they possess the very same beliefs, character, desires, memories, and so on, with only very slight changes). In this case, our identity judgment is true in virtue of the obtaining of both physical and psychological continuities. The puzzle of personal identity is: which continuity (if any) is the more important or central to our concept of personal identity? Evidently, reflection on the paradigm case just described will not help us to answer that question. We need to consider thought experiments where the continuities come apart.

There are three broad accounts or criteria of personal identity over time: the physical criterion, the psychological criterion, and the mixed criterion. These criteria do not purport just to offer quite general ways of telling or of finding out who is who. They also purport to specify what the identity of persons over time consists in: what it is to be the same person over time. According to the physical criterion, the identity of a person over time consists in the obtaining of some relation of physical continuity (typically either bodily continuity or brain continuity). On this view, to be the same person is to be the same living biological object (whether body or brain).

According to the psychological criterion, the identity of a person over time consists in the obtaining of relations of psychological continuity (overlapping memory chains, or memory together with the retention of other psychological features such as well-entrenched beliefs, character, basic desires, and so on). The psychological criterion splits into a narrow version and a wide version. According to the narrow version, the cause of the psychological continuity must be normal (that is, the continued existence of one's brain) if it is to preserve personal identity; according to the wide version, any cause will suffice (normal or abnormal). Sub-versions of the wide and narrow versions differ over the question of whether any one psychological relation is privileged with respect to identity preservation. (For example, Locke, in his *An Essay Concerning Human Understanding*, thought that memory was such a privileged relation.)

Each of the physical and psychological criteria divides into many different versions. The distinctive claim of the mixed criterion is that no version of either the physical or psychological criterion is correct. The best account of a person's identity over time will make reference to both physical and psychological continuities.

I now want to examine in more detail different versions of the physical and psychological criteria. My conclusion will be that all familiar versions of these criteria are open to objection, and that we should accept the mixed criterion. The mixed criterion best captures our core (that is, minimally controversial) beliefs about personal identity.

We can begin with the physical criterion. As noted, this criterion divides into two criteria: the bodily criterion and the brain criterion.

2 Physical criteria

Physical criteria: the bodily criterion. According to the bodily criterion, person A at time t_1 is identical to person B at t_2 if and only if A and B have the same body (that is, they are bodily continuous). Note that A and B can truly be said to have the same body, even though the body at the later time has no matter in common with the body at the earlier time (see CONTINUANTS). In such a case, however, the replacement of matter must be gradual, and the new matter must be functionally absorbed into the living body. This is how it is in the life of a normal human being.

The bodily criterion accords with most of our ordinary judgments of personal identity. However, there appear to be logically possible cases in which the deliverances of the bodily criterion conflict with our considered judgments. The particular case I have in mind is that of brain transplantation. Such transplants are, of course, technologically impossible at present; but that is hardly relevant. The speculations of philosophers are not confined to what is technologically possible.

Sydney Shoemaker was the first to introduce such cases into the philosophical literature. In his work *Self-Knowledge and Self-Identity* he wrote:

> It is now possible to transplant certain organs . . . it is at least conceivable . . . that a human body could continue to function normally if its brain were replaced by one taken from another human body. . . . Two men, a Mr. Brown and a Mr. Robinson, had been operated on for brain tumors, and brain extractions had been performed on both of them. At the end of the operations, however, the assistant inadvertently put Brown's brain in Robinson's head, and Robinson's brain in Brown's head. One of these men immediately dies, but the other, the one with Robinson's head and Brown's brain, eventually regains consciousness. Let us call the latter 'Brownson'. . . . When asked his name he automatically replies 'Brown'. He recognizes Brown's wife and family . . . , and is able to describe in detail events in Brown's life . . . of Robinson's life he evidences no knowledge at all.

We can suppose, in addition, that Brown and Robinson are physically very similar, and that their bodies are equally suited for the realization of particular dispositions or abilities (for example, playing the piano, or hang-gliding).

The description of this case which commands almost universal assent is that Brown is the same person as Brownson. Virtually no one thinks that the correct description is: Robinson acquires a new brain. Receiving a new skull and a new body seems to be just a limiting case of receiving a new heart, new lungs, new legs, and so on. If Brown is the same person as Brownson, and yet Brownson's body is not the same body as Brown's body, then it follows that the bodily criterion is false.

Physical criteria: the brain criterion. In the light of this example, it would be natural for a defender of the physical criterion to move to the brain criterion: A at t_1 is the same person as B at t_2 if and only if A and B possess the same brain. But is this a plausible criterion of personal identity? I think not. The following scenario is conceivable. Imagine that robotics and brain science have advanced to such a stage that it is possible to construct a silicon brain which supports the very same kind of mental life as that supported by a flesh-and-blood human brain. Imagine also that parts of a human brain (say, a cancerous part) can be replaced by silicon chips which subserve the very same mental functions as the damaged brain tissue.

Suppose that the whole of my brain gradually becomes cancerous. As soon as the surgeons detect a cancerous part, they replace it with silicon chips. My mental life continues as before – the same beliefs, memories, character, and so on, are preserved. Eventually, the surgeons replace all my biological brain with a silicon brain. Since my mental life, and physical appearance and abilities, are unaffected by this replacement, we have no hesitation in judging that I have survived the operation. The procedure preserves personal identity. But is this judgment of personal identity consistent with the brain criterion? The answer to this question depends on whether my (later) silicon brain is deemed to be identical to my (earlier) human brain.

It is plausible to suppose that, if an object (such as a heart, brain or liver) is biological, then that very object is essentially biological. That is, for example, my flesh-and-blood brain could not have been anything but a biological entity. This essentialist thesis is consistent with the view that the function of any given biological object (a human heart, for example) could, in principle, be carried out by a non-biological object (a mechanical pump, say). Hence, I am happy to concede that my later silicon brain is indeed a brain; but it is not remotely plausible to think that it is the same brain as my earlier human brain. Rather, the effect of all the tissue removals and bionic insertions in my skull is to destroy one brain and replace it with another.

Our brain example shows that the sort of matter or stuff with which we replace an object's removed parts can affect the overall identity of that object, even if continuity of form or function is preserved. My (earlier) human brain is not identical to my (later) silicon brain. Yet I survived the operation. Hence, the brain criterion is false.

However, there is a deeper worry about the tenability of the brain criterion. Why did we move to the brain criterion, in response to counterexamples to the bodily criterion? Was it because the human brain is a three-pound pinkish-grey spongy organ that occupies human skulls? No, we moved to the brain criterion because of what the human brain does, namely, supports directly our mental life. It is surely because of its mind-supporting function that we are inclined to single out the brain as the seat of personal identity. Consequently, we should not see our identity over time as tied necessarily to the continued existence of the human brain we presently have. What matters most is that our stream of mental life continues to be supported by some physical object, not that it continues to be supported by the very same biological organ.

Since the mid-1990s there has been a vigorous debate, sparked by Eric Olson's book *The Human Animal* (1997), over a version of the Physical Criterion called 'Animalism'. According to Animalism, each of us is identical to a particular animal

(in our case, of the kind *human being*). Hence our conditions of identity are just those of human beings. Animalism, like all versions of the Physical Criterion, is vulnerable to the objections raised in §3. However, Olson nicely brings out the following difficulty for any denier of Animalism: if I and the animal I share my matter with (call him 'A') are not identical, then how do we block the absurd conclusion that there are two thinkers/subjects of experience in my shoes? I and A are atom-for-atom identical: why should I have the status of a person while A is denied that status? Olson thinks no good answer can be given to these questions; hence the only way to avoid the absurd conclusion is to embrace Animalism. It is fair to say that responding to Olson's reasoning is one of the most pressing issues in the current discussion of personal identity.

3 Psychological and mixed criteria

The bionic brain example appears to undermine not just the brain criterion, but also the narrow version of the psychological criterion – I survive with a bionic brain, yet the cause of my psychological continuity is abnormal. Hence, it might be thought, the combined effect of these conclusions is to push us towards the wide version of the psychological criterion. Indeed, there are other thought-experiments which might be thought to establish the wide version of the psychological criterion.

Bernard Williams describes a device which can wipe a brain clean while recording all the information stored in the brain. This machine can then reprogramme that information into another brain. The machine can thus preserve psychological continuity in the absence of any physical continuity. And Derek Parfit has made use of the Star Trek fantasy of teletransportation. Here a physical and psychological blueprint is made of a person, who is then painlessly destroyed. The blueprint is transmitted to another location where, out of different matter, an exact physical and psychological replica of the original person is made.

Some philosophers have claimed that, in both these examples, the original person is identical to the later person, and so concluded that physical continuity is not necessary for personal identity over time. Other philosophers have taken the opposite view, and concluded that physical continuity is necessary for personal identity over time. But these are judgments in which theory is being allowed to dictate intuitions. In truth, there simply is no general agreement about whether the original is the same person as the replica, in cases in which there is psychological continuity but no physical continuity.

Further, there appears to be a decisive objection to the wide version of the psychological criterion – the criterion which holds that personal identity over time consists in psychological continuity, however that continuity is caused. (A defender of the wide version would agree with my verdicts about the counterexamples to the body and brain criteria, and would also regard the normal operation of the brain-state transfer device and the teletransporter as identity-preserving.) Imagine that I step into the teletransporter booth. My psychophysical blueprint is constructed, and sent to another location, where a replica is created. Unfortunately, the machine malfunctions and fails to destroy me. I step out of the booth, intrinsically no different from when I went in. In this case, we have no hestitation in judging that I continue to exist in the same body, and therefore that the replica is not me. But both me-later and my replica stand to me-earlier in the relation of psychological continuity. If the cause of that continuity is deemed to be irrelevant to personal identity, as in the wide version of the psychological criterion, then it ought to be the case that both later candidates have an equal claim to be me. Yet, as we have seen, we strongly believe that I am identical to the later person who is physically and psychologically continuous with me. Consequently, the wide version of the psychological criterion cannot be correct.

I conclude that the best account of personal identity over time is provided by the mixed criterion. We have seen that neither continuity of body nor brain (nor, by extension, the continuity of any other human organ) is a necessary condition for personal identity over time. But we should not conclude from this that psychological continuity, whatever its cause, is sufficient for personal identity over time. As just noted, that thesis does not accord with our intuitions. The most consistent and plausible view that can be recovered from our core set of common-sense judgments appears to be the following: psychological continuity is necessary for personal identity over time; a sufficient condition of personal identity over time is not psychological continuity with any cause, but psychological continuity with a cause that is either normal or continuous with the normal cause (this is why I continue to exist with a bionic brain). One might well ask: why do we have only this concept of personal identity and not some other (such as the wide version of the psychological criterion)? Here, as with other conceptual analyses, there may be no non-trivial answer to this question.

Our discussion thus far has made a certain simplification. The counterexample to the wide version of the psychological criterion exploited the fact that relations of psychological continuity are not logically one-one. In that example, one of the streams of psychological continuity did not have a

normal cause. However, it is logically possible for a person at one time to be psychologically continuous with two or more later persons, even when both streams of psychological continuity have their normal cause (that is, the continued existence of the brain hemispheres). But the relation of identity is logically one-one: I cannot be identical to two distinct people. It seems, therefore, that the sufficient condition for personal identity endorsed in the previous paragraph will have to be modified, unless either such branching is impossible or the possibility of branching can be redescribed so that it does not conflict with our sufficient condition. The problem raised by the possibility of branching continuities is known as the problem of fission.

4 Fission of persons

As we have seen, much work in personal identity has made use of various thought experiments or imaginary scenarios. The method of thought experiments in personal identity has recently been subject to criticism. It has been claimed that we should not take our intuitions about thought experiments as guides to philosophical truth, since such intuitions may be prejudiced and unreliable. These criticisms are, I think, misplaced. For one thing, such criticisms ignore the frequent and legitimate use of thought experiments in virtually all traditional areas of philosophy (for example, in theories of knowledge and in ethics). Why is their use in discussions of personal identity singled out for criticism? Second, and more important, thought experiments can be useful in understanding the structure of a concept and the relative importance of its different strands, provided that there is general agreement about the best description of the thought-experiment. There is such general agreement about the counterexamples to the body and brain criteria. Some philosophers have tried to gain mileage from thought experiments in the absence of such general agreement – for example, the case of teletransportation discussed above. But it would be unwarranted to infer from the existence of such abuses that thought experiments can never perform any useful function in discussions of personal identity (see Thought experiments).

One thought experiment which has been much discussed in recent years, and which does not fall into the teletransporter category of thought experiments, is that of the fission or division of persons. This thought experiment is interesting because it shows us something about the nature or metaphysics of personal identity, about what it is to be the same person over time.

Fission is a situation in which one thing splits into two (or more) things. Fission does occur in nature (amoebae, for example). Fission of persons, of course, does not occur – but it might. We can devise a thought experiment to flesh out this possibility. Consider a person, Arnold. Like us, Arnold has a mental life that is crucially dependent upon the normal functioning of his brain. Arnold also has a property which most of us do not have, but might have done: each of his brain hemispheres support the very same mental functions. If one of Arnold's hemispheres developed a tumour, that hemisphere could simply be removed and Arnold's mental life would be unaffected.

Suppose that Arnold's body develops cancer. The surgeons cannot save his body, but they can remove Arnold's brain and transplant both hemispheres into two brainless bodies, cloned from Arnold's body many years ago. Arnold agrees to this and the operation is successfully carried out. The fission of Arnold has taken place. We now have two people – call them Lefty and Righty – both of whom are psychologically continuous with Arnold (same character, beliefs, apparent memories of a common past, and so on). They are also physically similar to Arnold, and each contain a hemisphere from Arnold's brain. There is both physical and psychological continuity linking Arnold with Lefty and with Righty. Suppose also that Lefty and Righty are in different rooms in the hospital, and exercise no causal influence on each other. How should this case be described – who is who? A number of responses have been suggested, which we shall examine in turn.

(1) *'The case is not really possible, so we can say nothing about it and learn nothing from it.'* This view is implausible. Hemisphere transplants may be technologically impossible; but they are surely not logically impossible. Indeed, hemisphere transplants, like other organ transplants, appear to be nomologically possible (that is, consistent with the laws of nature). If so, such transplants are also logically possible. Response (1) is not a serious contender.

(2) *'Arnold has survived the operation, and is one or the other of Lefty or Righty.'* Immediately after fission, Lefty and Righty are physically and psychologically indistinguishable. Both stand in the same psychological and physical relations to Arnold. They both believe that they are Arnold. According to response (2), one is right and the other wrong.

Response (2) is implausible for two reasons. First, since Lefty and Righty are symmetrically related to Arnold in respect of physical and psychological continuities, the claim that, for example, Arnold is Lefty, can only be sustained on something like the Cartesian view of persons. If we think of the person as an immaterial ego that typically underlies streams of psychological life, we can suppose that Arnold's ego pops into the left-hand stream of consciousness,

leaving the right-hand stream ego-less or with a new ego. As noted at the beginning of §1, this view of persons is bizarre. The postulation of such an ego is idle, and conflicts with both science and common sense.

Second, the metaphysical absurdity of the Cartesian view has an epistemic counterpart. According to response (2), when Arnold divides, he survives in one of the two streams. So either Arnold is Lefty or Arnold is Righty. But how can we know which? From the third-person point of view, we have no reason to make one identification rather than the other. Nor is appeal to the first-person perspective of any help: both Lefty and Righty take themselves to be Arnold. Nothing in either stream of consciousness will reveal to its bearer that it is Arnold. So if, for example, Arnold is Lefty, this truth will be absolutely unknowable. There may be no incoherence in the idea of unknowable truths, but we should be suspicious of any theory of personal identity which implies that truths about who is who can be, in principle, unknowable. For these reasons, we should reject response (2).

(3) *'Arnold survives fission as both Lefty and Righty.'* There are three ways in which we can understand this response. According to the first way, Lefty and Righty are sub-personal components of a single person, Arnold. According to the second way, Arnold is identical to both Lefty and Righty (hence, Lefty is Righty). According to the third way, Lefty and Righty together compose Arnold (so that two persons are parts of one larger person, just as Scotland and England are parts of one larger country).

These views are hard to believe. It seems plain common sense that Lefty and Righty are both persons (not sub-personal entities), and that they are numerically distinct. Lefty and Righty both satisfy the normal physical and psychological criteria for personhood. They qualify as persons. And they are two. They may be exactly alike immediately after fission, but exact similarity does not imply numerical identity. (Two red billiard balls may be exactly similar, yet numerically distinct.) Further, they will soon begin to differ, mentally and physically, so that it would be intolerable to regard them as anything but distinct persons.

According to the remaining version of response (3), Arnold exists after fission composed of Lefty and Righty, now regarded as persons in their own right. This is sheer madness. The postulation of Arnold's existence in this circumstance (in addition to that of Lefty and Righty) does no work whatsoever. It is completely idle. Second, can we really make any sense of the idea that one person might be composed of two separate persons? That one person might be composed of two bodies and two minds? To be a single person is to possess a unified mental life. (This is why we are sometimes reluctant to regard a split-brain patient as constituting a single person.) Yet, supposedly, after fission Arnold is permanently composed of two unconnected spheres of consciousness. How could they possibly constitute a single person? If Lefty believes that Clinton will win the next election, and Righty believes that he will not, does Arnold believe that Clinton will both win and lose the next election? Such problems multiply. It seems that all ways of understanding response (3) skew our concept of a person to such an extent that they cannot be taken seriously.

5 Fission of persons (cont.)

(4) *'The case of Arnold's fission has been misdescribed. Lefty and Righty exist prior to fission, but only become spatially separate after fission.'* This theory also has different versions. Some philosophers think that only Lefty and Righty occupy the pre-fission body, and that the name Arnold is ambiguous. Others think that three people (Arnold, Lefty and Righty) occupy the pre-fission body, but that only Lefty and Righty survive fission. The differences between these versions of the theory will not concern us.

This theory is very strange. It involves a tremendous distortion of our concept of a person to suppose that more than one person occupies the pre-fission body. Surely to one body and a unified mind there corresponds only one person? However, the strangeness of response (4) may depend on one's general metaphysics. In particular, the degree of strangeness may depend on whether we accept a three- or four-dimensional view of continuants such as persons.

On the three-dimensional view of persons, persons are wholly present at all times at which they exist (much as a universal, such as redness, is said to be wholly present in each of its instantiations). On this view, persons are extended only in space, not in time, and have no temporal parts. On the four-dimensional view of persons, persons are four-dimensional entities spread out in space and time. Persons have temporal parts as well as spatial parts. Hence, at any given time, say 1993, only a part of me is in existence, just as only a part of me exists in the spatial region demarcated by my left foot. (See the entry on TIME for more on the contrast between three- and four-dimensional views.)

On the three-dimensional view of persons, response (4) is not just strange but barely intelligible. Consider a time just prior to fission. On this view, two wholly present persons (entities of the same

kind) occupy exactly the same space at the same time. This ought to be as hard to understand as the claim that there are two instantiations of redness in some uniformly coloured red billiard ball. On the four-dimensional view, however, Lefty and Righty are distinct persons who, prior to fission, share a common temporal part. It ought to be no more remarkable for two persons to share a common temporal part than for two persons (Siamese twins) to share a common spatial part.

Suppose, for present purposes, that we accept the four-dimensional view. Response (4) is still counter-intuitive. It is implausible to hold that two persons (Lefty and Righty) share a common temporal segment in the absence of any psychological disunity. We should be loath to give up the principle that to each psychologically unified temporal segment there corresponds just one person. Second, there is the problem of how we are to account for the coherence and unity of the I-thoughts associated with the locus of reflective mental life that occupies the pre-fission body. How can there be such unity if two persons occupy that body? These objections to response (4) may not be decisive, but they do show that the multiple occupancy view is problematic, and we should avoid it if we can.

(5) *'What's the problem? When Arnold divides into Lefty and Righty, Arnold ceases to exist (one thing cannot be two). Lefty and Righty then come into existence, and are numerically distinct, though initially very similar, persons.'* This is the response I favour. When Arnold divides, there are two equally good candidates for identity with him. Since they are equally good, and since one thing cannot be two things, Arnold is identical to neither. And since there is no one else with whom we could plausibly identify Arnold, Arnold no longer exists. This response respects the logic of identity, and does not violate our concept of a person by supposing that one (post-fission) person is composed of two persons or that more than one person occupies the pre-fission body. This is a victory for common sense!

Indeed it is so. But it is important to realize that, in embracing response (5), we are committing ourselves to a quite particular conception of the identity over time of persons. On this view, Arnold is not Lefty. Why is this true? The reason given is not: because Arnold and Lefty do not have the same body, or because Arnold and Lefty do not have the same (whole) brain. (These would anyway be bad reasons – see §1.) The reason is that one thing cannot be two. Arnold is not Lefty because Righty also exists. Whether Arnold continues to exist depends upon whether he has one continuer or two. Since Lefty and Righty are causally isolated from each other, this implies that the identity over time of a person can be determined by extrinsic factors. Theories that allow for such extrinsicness are sometimes called best-candidate theories of personal identity. According to these theories, B at t_2 is the same person as A at t_1 if and only if there is no better or equally good candidate at t_2 for identity with A at t_1. If there are two equally good candidates, neither is A.

Are such theories, and hence response (5), acceptable? Some philosophers have thought not, but for bad reasons. It has been thought that best-candidate theories violate the widely accepted thesis that identity sentences are, if true, necessarily true and, if false, necessarily false. Is not the upshot of response (5) precisely that Arnold is not Lefty, but that had Righty not existed (had the surgeon accidently dropped the right hemisphere, for example), Arnold would have been Lefty? Here we have to be careful. The widely accepted thesis is that identity sentences containing only rigid singular terms (that is, terms which do not shift their reference across possible worlds) are, if true, necessarily true and, if false, necessarily false. We can read the term Lefty as rigid or as non-rigid. If it is non-rigid (perhaps abbreviating the definite description 'the person who happens to occupy the left-hand branch'), then it is true that, had Righty not existed, Arnold would have been Lefty. But this result is consistent with the necessity of identity and distinctness. If Lefty is rigid, then the best-candidate theorist, if he is to respect the necessity of identity, must deny that Arnold would have been Lefty if Righty had not existed. If Righty had not existed, Arnold would then have occupied the left-hand branch, but that person (namely, Arnold) is not Lefty. Lefty doesn't exist in the nearest world in which Righty does not exist, though an exact duplicate of Lefty – twin Lefty – exists there.

Best-candidate theories do not violate the necessity of identity. However, they do have consequences that might be thought objectionable. Consider again the world in which Arnold divides into Lefty and Righty. According to the best-candidate theory, Lefty can truly say, 'Thank goodness Righty exists, otherwise I wouldn't have existed'. Given that Lefty and Righty exert no causal influence on each other, such dependency is apt to seem mysterious.

These consequences are not objectionable. They simply illustrate the fact that properties like being occupied by Lefty (where Lefty is understood to be rigid) are extrinsic properties of bodies. That is, whether the left-hand body has the property of being occupied by Lefty, rather than by Twin Lefty, is fixed by an extrinsic factor (namely, the existence or non-existence of Righty). But this is not

counter-intuitive. The property being occupied by Lefty is not a causal property of a body. In contrast with properties of shape and weight, and so on, this identity-involving property does not contribute to the causal powers of any body in which it inheres. (The causal powers of the left-hand body are unaffected by whether Lefty or Twin Lefty is the occupant.) It is typical of a non-causal property that its possession by an object may depend upon what happens to other objects which exercise no causal influence on it. For example, the property of being a widow is not a causal property and, unsurprisingly, whether a woman is a widow may depend upon what happens to someone who, at the relevant time, exercises no causal influence on her. Response (5) teaches us that identity-involving properties (like being occupied by Lefty) are also extrinsic. This is not a counter-example, merely a consequence.

The best-candidate theory provides the most satisfying response to the case of fission. It also reveals something important about our concept of personal identity: its structure is that of an extrinsic concept. This result may be surprising, but it is not objectionable. If we combine this result with the central claim of the last section, we arrive at the following modified sufficient condition for personal identity over time: A at t_1 is identical to B at t_2 if A stands to B in the relation of psychological continuity with a cause that is either normal or continuous with the normal cause, and there is no better or equally good candidate at t_2 for identity with A at t_1.

6 Value theory

In this final section, I investigate the implications (if any) of the metaphysics of personal identity for value theory. A contemporary philosopher, Derek Parfit, is the most well-known advocate of such implications: he argues that the most plausible metaphysics of persons yields radical conclusions for ethics and rationality (value theory).

It has, of course, long been acknowledged that there is a link between theories of persons and value theory. For example, a religious person's belief that we are immaterial souls will obviously bear on their view of the morality of abortion and euthanasia. However, in this case, the value of persons is not called into question; what is in question is simply the extension of the concept person. The intent of Parfit's project is far more subversive: it is to undermine the significance we currently attach to personal identity and distinctness. Whether or not it is ultimately successful, it is important to recognize the form or shape of this project.

The central feature of Parfit's value theory is the thesis that personal identity is not, in itself, an important relation. It is various psychological relations which matter, relations which are concomitants of personal identity in the normal case (but not, for example, in the case of fission). According to this theory, it would be irrational of me strongly to prefer my own continued existence to death by fission.

I will be concerned with arguments for the thesis that personal identity is not what matters. This thesis has two strands. One strand is that personal identity over time is unimportant; the other strand is that personal identity at a time is unimportant. (These are the diachronic and synchronic strands, respectively.) The thesis that the identity of a person over time is unimportant has been taken to undermine the self-interest theory of rationality, and has implications for the tenability of trans-temporal moral notions such as compensation, responsibility and personal commitment. The thesis that the identity and distinctness of persons at a time is unimportant has been thought to lend support to utilitarianism.

The thesis that personal identity over time is unimportant implies that pure self-interested concern is irrational. That is, it is irrational for me to be especially concerned about the fate of some future person just because that person is me. It follows that the self-interest theory of rationality is false. According to this theory, which has dominated so much thinking about rationality (see Rationality, practical), there is only one future person that it is supremely rational for me to benefit: the future person identical to me. Since the self-interest theory places immense weight on a relation which has no rational significance, this theory cannot be correct.

Further, if we do not believe that personal identity over time is important, this may change our attitude to punishment, compensation and commitment. Consider a case where there are only weak psychological connections between different stages of the same life. (For example, a one-time criminal may now be completely reformed, with a new and more respectable set of desires and beliefs.) On the present view, the grounds are thereby diminished for holding the later self responsible for the crimes of the earlier self, or for compensating the later self for burdens imposed on the earlier self, or for regarding earlier commitments as binding on the later self. The truth that the earlier person is the later person is too superficial or unimportant to support the opposite view.

The thesis that the identity and distinctness of persons at a time is unimportant has been taken to imply that the fact of the 'separateness of persons' is not 'deep', and that less weight should be assigned to distributive principles. The synchronic thesis thus supports (in part) the utilitarian doctrine that no

weight should be assigned to distributive principles: we should simply aim to maximize the net sum of benefits over burdens, whatever their distribution (see UTILITARIANISM).

These are radical claims. They are all underwritten by the thesis that personal identity is not what matters. What are the arguments for this thesis? I shall discuss one argument for the diachronic thesis (the argument from fission), and one argument for the synchronic thesis (the argument from reductionism).

Recall our earlier discussion of fission. I argued that the most plausible description of fission is that the pre-fission person is numerically distinct from the post-fission offshoots. This constitutes the first premise of the argument from fission (which I will present in the first person): (1) I am not identical to either of my fission products. The second premise is this: (2) fission is not as bad as ordinary death. This premise is taken to imply a third: (3) my relation to my offshoots contains what matters. The first and third premises jointly imply that personal identity is not what matters.

This is an interesting argument, which has had many adherents in recent years. But there is a problem with it. The problem concerns the move from the second to the third premise. The second premise is certainly true: the prospect of fission is not as bad as that of ordinary death. What grounds this premise, and what exhausts its true content, is simply that presented with a choice between those two options, virtually everyone would choose fission. Such a choice is both explicable and reasonable: after fission, unlike after ordinary death, there will be people who can complete many of my projects, look after my family, and so on. However, if the third premise is grounded in the second, the claim that my relation to my offshoots contains what matters merely reflects the innocuous truth that fission is preferable to ordinary death. This robs the argument of any radical import. Its conclusion does nothing to undermine the rationality of self-interest, or the rationality of strongly preferring continued existence to both fission and ordinary death. (This argument is not improved if it is merely asserted that fission is just as good as ordinary survival. What is the argument for this claim?)

What of the argument from reductionism? Reductionism is the view that a description of reality which refers to bodies and experiences, but omits reference to persons, can be complete. It would leave nothing out (see PERSONS §3). The argument from reductionism attempts to show that, if reductionism is true, the fact of the separateness of persons (the fact that you and I are distinct persons, for example) is not deep or significant, and hence less weight should be assigned to distributive principles.

The argument can be presented as follows. Suppose that reductionism is true: reality can be completely described without reference to persons. If such a complete and impersonal description is possible, how can the boundaries between persons be important? Failing an answer to this question, the argument from reductionism concludes that the boundaries between persons are not morally significant.

The validity of this argument turns on the truth of the general principle that if reality can be completely described without referring to Fs, then the boundaries between Fs cannot be of any importance. Both the interpretation and plausibility of this principle are unclear. A more definite worry is that reasons may be presented for dissatisfaction with the argument's premise, reductionism about persons. (In particular: can our mental life really be completely described in impersonal or identity-neutral terms?) Unless those objections can be met, we should reject the argument from reductionism.

The central arguments for the thesis that identity is not what matters are both open to dispute. The failure of these arguments emphasizes how difficult it is to undermine the importance I attach to the fact that such-and-such a person tomorrow is me, and to the fact that you are not me. Unless other arguments are forthcoming, we can continue reasonably to believe that personal identity is important, and to endorse the traditional views in ethics and rationality which that belief supports.

PERSONALISM

Personalism is the thesis that only persons (self-conscious agents) and their states and characteristics exist, and that reality consists of a society of interacting persons. Typically, a personalist will hold that finite persons depend for their existence and continuance on God, who is the Supreme Person, having intelligence and volition. Personalists are usually idealists in metaphysics and construct their theories of knowledge by inference from the

data of self-awareness. They tend to be nonutilitarian in ethics and to place ultimate value in the person as a free, self-conscious, moral agent, rather than in either mental states or in apersonal states of affairs. Typically, holding that a good God will not allow what has intrinsic value to lose existence, they believe in personal survival of death.

The term 'personalism', even as a term for philosophical systems, has myriad uses. There is said to be, for example, atheistic personalism (as in the case of McTaggart, famous for embracing both atheism and the immortality of the soul), absolute idealistic personalism (Hegel, Royce, Calkins), and theistic personalism (Bowne, Brightman, Bertocci). Leibniz and Berkeley are seen as early personalists; both were theists and idealists. Kant, while not strictly a personalist, was influential in personalism's history. In particular, B.P. Bowne (1847–1910) borrowed freely from Kant, while refusing to accept a Kantian transcendentalism in which our basic concepts or categories apply in a knowledge-giving way only to appearances and not to reality. R.H. Lotze made personality and value central to his worldview, and was a European precursor of American personalism.

PERSONS

We are all persons. But what are persons? This question is central to philosophy and virtually every major philosopher has offered an answer to it. For two thousand years many philosophers in the Western tradition believed that we were immaterial souls or Egos, only contingently attached to our bodies. The most well-known advocates of this view were Plato and Descartes. Few philosophers accept this view now, largely because it is thought to face a number of intractable metaphysical and epistemological problems (for example: how can an immaterial soul or mind interact with the material world? How can I know that you have a soul?). The recoil from Cartesianism has been in three different directions. One direction (the animalist) emphasizes the fact that persons are human beings, evolved animals of a certain sort. A second direction (the reductionist) is represented by David Hume: the self or person is not a Cartesian entity, it is a 'bundle of perceptions'. Finally, there is a theory of persons influenced by the views of John Locke, according to which persons are neither essentially animals nor reducible to their bodies or experiences.

PHENOMENALISM

On its most common interpretation, phenomenalism maintains that statements asserting the existence of physical objects are equivalent in meaning to statements describing sensations. More specifically, the phenomenalist claims that to say that a physical object exists is to say that someone would have certain sequences of sensations were they to have certain others. For example, to say that there is something round and red behind me might be to say, in part, that if I were to have the visual, tactile and kinaesthetic (movement) sensations of turning my head I would seem to see something round and red. If I were to have the sensations of seeming to reach out and touch that thing, those sensations would be followed by the familiar tactile sensations associated with touching something round.

Rather than talk about the meanings of statements, phenomenalists might hold that the fact that something red and round exists is no more than the fact that a subject would have certain sequences of sensations following certain others. The phenomenalist's primary motivation is a desire to avoid scepticism with respect to the physical world. Because many philosophers tied the meaningfulness of statements to their being potentially verifiable, some phenomenalists further argued that it is only by reducing claims about the physical world to claims about possible sensations that we can preserve the very intelligibility of talk about the physical world.

There are very few contemporary philosophers who embrace phenomenalism. Many reject the foundationalist epistemological framework which makes it so difficult to avoid scepticism without phenomenalism. But the historical rejection of the view had more to do with the difficulty of carrying out the promised programme of translation.

RICHARD FUMERTON

PHENOMENOLOGICAL MOVEMENT

The phenomenological movement is a century-old international movement in philosophy that has penetrated most of the cultural disciplines, especially psychiatry and sociology. It began in Germany with the early work of Edmund Husserl, and spread to the rest of Europe, the Americas and Asia. In contrast with a school, a movement does not have a body of doctrine to which all participants agree; rather, there is a broad approach that tends to be shared. The phenomenological approach has at least four components.

First, phenomenologists tend to oppose naturalism. Naturalism includes behaviourism in psychol-

ogy and positivism in social sciences and philosophy, and is a worldview based on the methods of the natural sciences. In contrast, phenomenologists tend to focus on the socio-historical or cultural lifeworld and to oppose all kinds of reductionism. Second, they tend to oppose speculative thinking and preoccupation with language, urging instead knowledge based on 'intuiting' or the 'seeing' of the matters themselves that thought is about. Third, they urge a technique of reflecting on processes within conscious life (or human existence) that emphasizes how such processes are directed at (or 'intentive to') objects and, correlatively, upon these objects as they present themselves or, in other words, as they are intended to. And fourth, phenomenologists tend to use analysis or explication as well as the seeing of the matters reflected upon to produce descriptions or interpretations both in particular and in universal or 'eidetic' terms. In addition, phenomenologists also tend to debate the feasibility of Husserl's procedure of transcendental *epoché* or 'bracketing' and the project of transcendental first philosophy it serves, most phenomenology not being transcendental.

Beyond these widely shared components of method, phenomenologists tend to belong to one or another of four intercommunicating and sometimes overlapping tendencies. These tendencies are 'realistic phenomenology', which emphasizes the seeing and describing of universal essences; 'constitutive phenomenology', which emphasizes accounting for objects in terms of the consciousness of them; 'existential phenomenology', which emphasizes aspects of human existence within the world; and 'hermeneutical phenomenology', which emphasizes the role of interpretation in all spheres of life. All tendencies go back to the early work of Husserl, but the existential and hermeneutical tendencies are also deeply influenced by the early work of Martin Heidegger. Other leading figures are Nicolai Hartmann, Roman Ingarden, Adolf Reinach and Max Scheler in realistic phenomenology, Dorion Cairns, Aron Gurwitsch and Alfred Schutz in constitutive phenomenology, Hannah Arendt, Jean-Paul Sartre, Maurice Merleau-Ponty, and Simone de Beauvoir in existential phenomenology, and Hans-Georg Gadamer and Paul Ricoeur in hermeneutical phenomenology.

LESTER EMBREE

PHENOMENOLOGY, EPISTEMIC ISSUES IN

Phenomenology is not a unified doctrine. Its main proponents – Husserl, Heidegger, Sartre and Merleau-Ponty – interpret it differently. However, it is possible to present a broad characterization of what they share. Phenomenology is a method of philosophical investigation which results in a radical ontological revision of Cartesian Dualism. It has implications for epistemology: the claim is that, when the foundations of empirical knowledge in perception and action are properly characterized, traditional forms of scepticism and standard attempts to justify knowledge are undermined.

Phenomenological method purports to be descriptive and presuppositionless. First one adopts a reflective attitude towards one's experience of the world by putting aside assumptions about the world's existence and character. Second, one seeks to describe particular, concrete phenomena. Phenomena are not *contents* of the mind; they all involve an experiencing subject and an experienced object. Phenomenological description aims to make explicit essential features implicit in the 'lived-world' – the world as we act in it prior to any theorizing about it. The phenomenological method reveals that practical knowledge is prior to propositional knowledge – knowing *that* arises from knowing *how.*

The key thesis of phenomenology, drawn from Brentano, is that consciousness is intentional, that is, directed onto objects. Phenomenologists interpret this to mean that subjects and objects are essentially interrelated, a fact which any adequate account of subjects and objects must preserve. Phenomenological accounts of subjects emphasize action and the body; accounts of objects emphasize the significance they have for us.

The aim to be presuppositionless involves scrutinizing scientific and philosophical theories (Galileo, Locke and Kant are especially challenged). Phenomenology launches a radical critique of modern philosophy as overinfluenced by the findings of the natural sciences. In particular, epistemology has adopted from science its characterization of the basic data of experience.

The influence of phenomenology on the analytic tradition has been negligible. The influence on the Continental tradition has been greater. The phenomenological critique of modern science and philosophy has influenced postmodern thought which interprets the modernist worldview as having the status of master narrative rather than truth. Postmodern thought also criticizes the positive phenomenological claim that there are essential features of the lived-world.

JANE HOWARTH

PHILO JUDAEUS

See Philo of Alexandria

PHILO OF ALEXANDRIA (*c.*15 BC–*c.*AD 50)

Philo of Alexandria is the leading representative of Hellenistic-Jewish thought. Despite an unwavering loyalty to the religious and cultural traditions of his Jewish community, he was also strongly attracted to Greek philosophy, in which he received a thorough training. His copious writings – in Greek – are primarily exegetical, expounding the books of Moses. This reflects his apologetic strategy of presenting the Jewish lawgiver Moses as the sage and philosopher *par excellence*, recipient of divine inspiration, but not at the expense of his human rational faculties. In his commentaries Philo makes extensive use of the allegorical method earlier developed by the Stoics. Of contemporary philosophical movements, Philo is most strongly attracted to Platonism. His method is basically eclectic, but with a clear rationale focused on the figure of Moses.

Philo's thought is strongly theocentric. God is conceived in terms of being. God's essence is unreachable for human knowledge (negative theology), but his existence should be patent to all (natural theology). Knowledge of God is attained through his powers and, above all, through his *Logos* ('Word' or 'Reason'), by means of which he stands in relation to what comes after him. In his doctrine of creation Philo leans heavily on Platonist conceptions drawn from reflection on Plato's *Timaeus*. The conception of a creation *ex nihilo* ('from nothing') is not yet consciously worked out. Philo's doctrine of human nature favours the two anthropological texts in Genesis 1–2, interpreting creation 'according to the image' in relation to the human intellect. With regard to ethics, both Stoic concepts and peculiarly Jewish themes emerge in Philo's beliefs. Ethical ideals are prominent in the allegorical interpretation of the biblical patriarchs.

Philo's influence was almost totally confined to the Christian tradition, which preserved his writings. He was unknown to medieval Jewish thinkers such as Maimonides.

DAVID T. RUNIA

PHILOPONUS (*c.*490–*c.*570 BC)

John Philoponus, also known as John the Grammarian or John of Alexandria, was a Christian philosopher, scientist and theologian. Philoponus' life and work are closely connected to the city of Alexandria and its famous Neoplatonic school. In the sixth century, this traditional centre of pagan Greek learning became increasingly insular, located as it was at the heart of an almost entirely Christian community. The intense philosophical incompatibilities between pagan and Christian beliefs come to the surface in Philoponus' work.

His œuvre comprised at least forty items on such diverse subjects such as grammar, logic, mathematics, physics, psychology, cosmology, astronomy, theology and church politics; even medical treatises have been attributed to him. A substantial body of his work has come down to us, but some treatises are known only indirectly through quotations or translations. Philoponus' fame rests predominantly on the fact that he initiated the liberation of natural philosophy from the straitjacket of Aristotelianism, though his non-polemical commentaries on Aristotle as well as his theological treatises deserve to be appreciated in their own right.

Philoponus' intellectual career began as a pupil of the Neoplatonic philosopher Ammonius, son of Hermeas, who had been taught by Proclus and was head of the school at Alexandria. Some of his commentaries profess to be based on Ammonius' lectures, but others give more room to Philoponus' own ideas. Eventually, he transformed the usual format of apologetic commentary into open criticism of fundamental Aristotelian-Neoplatonic doctrines, most prominently the tenet of the eternity of the world. This renegade approach to philosophical tradition, as well as the conclusions of his arguments, antagonized Philoponus' pagan colleagues; they may have compelled him to abandon his philosophical career. Philoponus devoted the second half of his life to influencing the theological debates of his time; the orthodox clergy condemned him posthumously as a heretic, because of his Aristotelian interpretation of the trinitarian dogma, which led him to enunciate three separate godheads (tritheism).

The style of Philoponus' writing is often circuitous and rarely entertaining. However, he combines an almost pedantic rigour of argument and exposition with a remarkable freedom of spirit, which allows him to cast off the fetters of authority, be they philosophical or theological. Although his mode of thinking betrays a strong Aristotelian influence, it also displays a certain doctrinal affinity to Plato, stripped of the ballast of Neoplatonic interpretation. His works were translated into Arabic, Latin and Syriac, and he influenced later thinkers such as Bonaventure, Gersonides, Buridan, Oresme and Galileo.

PHOTOGRAPHY, AESTHETICS OF

Claims that photography is aesthetically different from and, in many versions of the argument,

inferior to the arts of painting and drawing have taken various forms: that photography is a mechanical process and therefore not an artistic medium; that it is severely limited in its capacity to express the thoughts and emotions of the artist; that its inability to register more than an instantaneous 'slice' of events restricts its representational capacity; that it is not a representational medium at all. Some of these arguments are thoroughly mistaken, while others have an interesting core of truth that will emerge only after some clarification. Central to this clarification is an account of the precise sense in which photography is mechanical, and an explication of our intuition that a photograph puts us 'in touch with' its subject in a way that a painting or drawing cannot. Both these ideas need to be separated from the mistaken view that it is the nature of photography to provide images that are superlatively faithful to the objects they represent.

PIAGET, JEAN (1896–1980)

The Swiss psychologist Jean Piaget was the founder of the field we now call cognitive development. His own term for the discipline was 'genetic epistemology', reflecting his deep philosophical concerns. Among Piaget's most enduring contributions were his remarkably robust and surprising observations of children. Time after time, in a strikingly wide variety of domains, and at every age from birth to adolescence, he discovered that children understood the world in very different ways from adults.

But Piaget was really only interested in children because he thought they exemplified basic epistemological processes. By studying children we could discover how biological organisms acquire knowledge of the world around them. The principles of genetic epistemology could then be applied to other creatures, from molluscs to physicists. Piaget's other enduring legacy is the idea that apparently foundational kinds of knowledge were neither given innately nor directly derived from experience. Rather, knowledge was constructed as a result of the complex interplay between organisms and their environment. Piaget saw this view as an alternative to both classical rationalism and empiricism.

ALISON GOPNIK

PICO DELLA MIRANDOLA, GIOVANNI (1463–94)

Giovanni Pico della Mirandola, today the best known of Renaissance philosophers, was a child prodigy and gentleman scholar who studied humanities, Aristotelianism and Platonism with the greatest teachers of his day. He claimed to have mastered, by the age of 24, all known theological systems, Christian and non-Christian, from Moses to his own time. He was the first important Christian student of the Jewish mystical theology known as Kabbalah. The purpose of Pico's philosophical and theological studies was to produce a grand synthesis of religious wisdom which would both deepen understanding of Christian truth and also serve as an apologetic weapon against non-Christians. This was the project outlined in Pico's most famous work, *De dignitate hominis* (*On the Dignity of Man*) (1486), and further illuminated by his *Conclusiones* (1486) and *Apologia* (1487). As part of this larger project, Pico planned to write a concord of Plato and Aristotle, of which only a fragment, the treatise *De ente et uno* (*On Being and the One*) (1491), was ever finished. Although he proposed to found a new theological school based on an esoteric reading of all theologies past and present, he did not believe that these theologies were the same in substance, differing only in expression. He insisted on the differences between Platonism and Christianity, while holding that every major theological tradition did contain some elements of truth.

In addition to other, non-philosophical works, Pico wrote the *Commento* (1486), a commentary on a Neoplatonic poem that in effect constituted a critique of Marsilio Ficino's most famous work, the dialogue *De amore* (*On Love*) (1469). He criticized Ficino as too literary and defended the use of precise technical language in philosophy. Pico used Neoplatonic metaphysics to rediscover the 'secret mysteries' of pagan theology (though he sometimes criticized the reliability of the Neoplatonists as guides to Plato's thought) and offered a fresh interpretation of the metaphysics of love based on his own reading of Platonic sources, seeing human

erotic love as a psychological process distinct from cosmic love.

JAMES HANKINS

PLATO (427–347 BC)

Introduction

Plato was an Athenian Greek of aristocratic family, active as a philosopher in the first half of the fourth century BC. He was a devoted follower of Socrates, as his writings make abundantly plain. Nearly all are philosophical dialogues – often works of dazzling literary sophistication – in which Socrates takes centre stage. Socrates is usually a charismatic figure who outshines a whole succession of lesser interlocutors, from sophists, politicians and generals to docile teenagers. The most powerfully realistic fictions among the dialogues, such as *Protagoras* and *Symposium*, recreate a lost world of exuberant intellectual self-confidence in an Athens not yet torn apart by civil strife or reduced by defeat in the Peloponnesian War.

Some of Plato's earliest writings were evidently composed in an attempt to defend Socrates and his philosophical mission against the misunderstanding and prejudice which – in the view of his friends – had brought about his prosecution and death. Most notable of these are *Apology*, which purports to reproduce the speeches Socrates gave at his trial, and *Gorgias*, a long and impassioned debate over the choice between a philosophical and a political life. Several early dialogues pit Socrates against practitioners of rival disciplines, whether rhetoric (as in *Gorgias*) or sophistic education (*Protagoras*) or expertise in religion (*Euthyphro*), and were clearly designed as invitations to philosophy as well as warnings against the pretensions of the alternatives. Apologetic and protreptic concerns are seldom entirely absent from any Platonic dialogue in which Socrates is protagonist, but in others among the early works the emphasis falls more heavily upon his ethical philosophy in its own right. For example, *Laches* (on courage) and *Charmides* (on moderation) explore these topics in characteristic Socratic style, relying mostly on his method of elenchus (refutation), although Plato seems by no means committed to a Socratic intellectualist analysis of the virtues as forms of knowledge. That analysis is in fact examined in these dialogues (as also, for example, in *Hippias Minor*).

In dialogues of Plato's middle period like *Meno*, *Symposium* and *Phaedo* a rather different Socrates is presented. He gives voice to positive positions on a much wider range of topics: not just ethics, but metaphysics and epistemology and psychology too. And he is portrayed as recommending a new and constructive instrument of inquiry borrowed from mathematics, the method of hypothesis. While there are continuities between Plato's early and middle period versions of Socrates, it is clear that an evolution has occurred. Plato is no longer a Socratic, not even a critical and original Socratic: he has turned Socrates into a Platonist.

The two major theories that make up Platonism are the theory of Forms and the doctrine of the immortality of the soul. The notion of a Form is articulated with the aid of conceptual resources drawn from Eleatic philosophy. The ultimate object of a philosopher's search for knowledge is a kind of being that is quite unlike the familiar objects of the phenomenal world: something eternal and changeless, eminently and exclusively whatever – beautiful or just or equal – it is, not qualified in time or place or relation or respect. An account of the Form of Beautiful will explain what it is for something to be beautiful, and indeed other things are caused to be beautiful by their participation in the Beautiful. The middle period dialogues never put forward any proof of the existence of Forms. The theory is usually presented as a basic assumption to which the interlocutors agree to subscribe. Plato seems to treat it as a very general high-level hypothesis which provides the framework within which other questions can be explored, including the immortality of the soul. According to *Phaedo*, such a hypothesis will only stand if its consequences are consistent with other relevant truths; according to the *Republic* its validity must ultimately be assured by its coherence with the unhypothetical first principle constituted by specification of the Good.

The Pythagorean doctrine of the immortality of the soul, by contrast, is something for which Plato presents explicit proofs whenever he introduces it into discussion. It presupposes the dualist idea that soul and body are intrinsically distinct substances, which coexist during our life but separate again at death. Its first appearance is in *Meno*, where it is invoked in explanation of how we acquire a priori knowledge of mathematical truths. Socrates is represented as insisting that nobody imparts such truths to us as information: we work them out for ourselves, by recollecting them from within, where they must have lain untapped as latent memory throughout our lives. But innate forgotten knowledge presupposes a time before the soul entered the body, when it was in full conscious possession of truth. *Phaedo* holds out the promise that the souls

of philosophers who devote their lives to the pursuit of wisdom will upon death be wholly freed from the constraints and contaminations of the body, and achieve pure knowledge of the Forms once again.

Republic, Plato's greatest work, also belongs to this major constructive period of his philosophizing. It gives the epistemology and metaphysics of Forms a key role in political philosophy. The ideally just city (or some approximation to it), and the communist institutions which control the life of its elite governing class, could only become a practical possibility if philosophers were to acquire political power or rulers to engage sincerely and adequately in philosophy. This is because a philosopher-ruler whose emotions have been properly trained and disciplined by Plato's reforming educational programme, and whose mind has been prepared for abstract thought about Forms by rigorous and comprehensive study of mathematics, is the only person with the knowledge and virtue necessary for producing harmony in society. Understanding of Forms, and above all of the Good, keystone of the system of Forms, is thus the essential prerequisite of political order.

It remains disputed how far Plato's vision of a good society ruled by philosopher-statesmen (of both sexes) was ever really conceived as a blueprint for practical implementation. Much of his writing suggests a deep pessimism about the prospects for human happiness. The most potent image in *Republic* is the analogy of the cave, which depicts ordinary humanity as so shackled by illusions several times removed from the illumination of truth that only radical moral and intellectual conversion could redeem us. And its theory of the human psyche is no less dark: the opposing desires of reason, emotion and appetite render it all too liable to the internal conflict which constitutes moral disease.

While *Republic* is for modern readers the central text in Plato's *œuvre*, throughout much of antiquity and the medieval period *Timaeus* was the dialogue by which he was best known. In this late work Plato offers an account of the creation of an ordered universe by a divine craftsman, who invests pre-existing matter with every form of life and intelligence by the application of harmonious mathematical ratios. This is claimed to be only a 'likely story', the best explanation we can infer for phenomena which have none of the unchangeable permanence of the Forms. None the less *Timaeus* is the only work among post-*Republic* dialogues, apart from a highly-charged myth in *Phaedrus*, in which Plato was again to communicate the comprehensive vision expressed in the Platonism of the middle period dialogues.

Many of these dialogues are however remarkable contributions to philosophy, and none more so than the self-critical *Parmenides*. Here the mature Parmenides is represented as mounting a powerful set of challenges to the logical coherence of the theory of Forms. He urges not abandonment of the theory, but much harder work in the practice of dialectical argument if the challenges are to be met. Other pioneering explorations were in epistemology (*Theaetetus*) and philosophical logic (*Sophist*). Theaetetus mounts a powerful attack on Protagoras' relativist theory of truth, before grappling with puzzles about false belief and problems with the perennially attractive idea that knowledge is a complex built out of unknowable simples. *Sophist* engages with the Parmenidean paradox that what is not cannot be spoken or thought about. It forges fundamental distinctions between identity and predication and between subject and predicate in its attempt to rescue meaningful discourse from the absurdities of the paradox.

In his sixties Plato made two visits to the court of Dionysius II in Sicily, apparently with some hopes of exercising a beneficial influence on the young despot. Both attempts were abysmal failures. But they did not deter Plato from writing extensively on politics in his last years. *Statesman* explores the practical knowledge the expert statesman must command. It was followed by the longest, even if not the liveliest, work he ever wrote, the twelve books of *Laws*, perhaps still unfinished at his death.

1 Life

Evidence about Plato's life is *prima facie* plentiful. As well as several ancient biographies, notably that contained in book III of Diogenes Laertius' *Lives of the Philosophers*, we possess a collection of thirteen letters which purport to have been written by Plato.

Unfortunately the biographies present what has been aptly characterized as 'a medley of anecdotes, reverential, malicious, or frivolous, but always piquant'. As for the letters, no scholar thinks them all authentic, and some judge that none are.

From the biographies it is safe enough to accept some salient points. Plato was born of an aristocratic Athenian family. He was brother to Glaucon and Adimantus, Socrates' main interlocutors in the *Republic*; his relatives included Critias and Charmides, members of the bloody junta which seized power in Athens at the end of the Peloponnesian War. He became one of the followers of Socrates, after whose execution he withdrew with others among them to the neighbouring city of Megara. His travels included a visit to the court of Dionysius in Sicily. On returning from Sicily to Athens he began teaching in a gymnasium outside the city, called the Academy.

The *Seventh Letter*, longest and most interesting of the collection of letters, gives a good deal of probably trustworthy information, whether or not it was written by Plato himself. It begins with an account of his growing disenchantment with Athenian politics in early adulthood and of his decision against a political career. This is prefatory to a sketch of the visit to Dionysius in Syracuse, which is followed by an elaborate self-justifying explanation of why and how, despite his decision, Plato later became entangled in political intrigue in Sicily, once the young Dionysius II had succeeded to his father's throne. There were two separate visits to the younger Dionysius: one (*c*.366 BC) is represented as undertaken at the behest of Dion, nephew of Dionysius I, in the hope of converting him into a philosopher-ruler; the other (*c*.360 BC) was according to the author an attempt to mediate between Dionysius and Dion, now in exile and out of favour. Both ventures were humiliating failures.

Of more interest for the history of philosophy is Plato's activity in the ACADEMY. We should not conceive, as scholars once did, that he established a formal philosophical school, with its own property and institutional structures. Although he acquired a house and garden in the vicinity, where communal meals were probably taken, much of his philosophical teaching and conversation may well have been conducted in the public space of the gymnasium itself. Some sense of the Academy's distinctive style may be gleaned from evidence of the contemporaneous writings of the philosophical associates he attracted, notably his nephew Speusippus, Xenocrates, ARISTOTLE and the mathematician EUDOXUS. Discussion of Plato's metaphysical ideas figured prominently in these; but orthodoxy was not expected, to judge from their philosophical disagreements with him and with each other. Aristotle's early *Topics* suggests that an important role was played by formal disputation about philosophical theses.

From the educational programme of the *Republic* one might have guessed that Plato would have attached importance to the teaching of mathematics as a preparation for philosophy, but we have better evidence for his encouraging research in it. While he was not an original mathematician himself, good sources tell us that he formulated problems for others to solve: for example, what uniform motions will account for the apparent behaviour of the planets. Otherwise there is little reliable information on what was taught in the Academy: not much can be inferred from the burlesque of comic playwrights. Since almost certainly no fees were charged, most of those who came to listen to Plato (from all over the Greek world) must have been aristocrats. Some are known to have entered politics or to have advised princes, particularly on constitutional reform. But the Academy had no political mission of its own. Indeed the rhetorician Isocrates, head of a rival school and admittedly not an unbiased witness, dismissed the abstract disciplines favoured by the Academy for their uselessness in the real world.

2 Writings

Thrasyllus, astrologer to the emperor Tiberius, is the unlikely source of the arrangement of Platonic writings adopted in the manuscript tradition which preserves them. For his edition of Plato he grouped them into tetralogies, reminiscent of the trilogies produced in Athenian tragic theatre. These were organized according to an architectonic scheme constructed on principles that are now only partially apparent, but certainly had nothing to do with chronology of composition. His arrangement began with a quartet 'designed to show what the life of the philosopher is like' (Diogenes Laertius, III 57): *Euthyphro*, or 'On Piety', classified as a 'peirastic' or elenctic dialogue (see SOCRATES §§3–4), which is a species of one of his two main genres, the dialogue of inquiry; *Apology*, *Crito* and *Phaedo* are all regarded as specimens of exposition, his other main genre, or more specifically as specimens of ethics. These four works are all concerned in one way or another with the trial and death of Socrates.

There followed a group consisting of *Cratylus*, or 'On the Correctness of Names', *Theaetetus*, or 'On Knowledge', *Sophist* and *Politicus* (often Anglicized as *Statesman*). Plato himself indicates that the last three of this set are to be read together. They contain some of his most mature and challenging work in epistemology, metaphysics and philosophical methodology. In this they resemble *Parmenides*,

with its famous critique of the theory of Forms, the first of the next tetralogy, which was completed by three major dialogues all reckoned 'ethical' by Thrasyllus: *Philebus*, an examination of pleasure, *Symposium* and *Phaedrus*, both brilliant literary divertissements which explore the nature of love.

A much slighter quartet came next: two dialogues entitled *Alcibiades*, plus *Hipparchus* and *Rivals*. None of these, with the disputed exception of the first *Alcibiades*, is thought by modern scholarship to be authentic Plato. They were followed by *Theages*, a short piece now generally reckoned spurious, *Charmides*, *Laches* and *Lysis*. These latter three works are generally regarded by modern scholars as Socratic dialogues: that is, designed to exhibit the distinctive method and ethical preoccupations of the historical Socrates, at least as Plato understood him, not to develop Plato's own philosophy. Thrasyllus would agree with the latter point, since he made them dialogues of inquiry: *Laches* and *Lysis* 'maieutic', in which the character 'Socrates' attempts as intellectual midwife to assist his interlocutors to articulate and work out their own ideas on courage and friendship respectively; *Charmides* elenctic, with the interlocutors Charmides and Critias and their attempts to say what moderation is put to the test of cross-examination, something Thrasyllus interestingly distinguished from philosophical midwifery.

The next group consisted of *Euthydemus*, *Protagoras*, *Gorgias*, *Meno*, important works in which modern scholarship finds analysis and further elaboration by Plato of the Socratic conception of virtue. The first three present a Socrates in argumentative conflict with sophists of different sorts (see SOPHISTS), so it is understandable that under the general heading 'competitive' Thrasyllus characterized *Euthydemus* and *Gorgias* as dialogues of refutation, and *Protagoras* as a dialogue of display – presumably because Protagoras and Socrates are each portrayed as intent on showing off their debating skills. *Meno*, on the other hand, is labelled an elenctic work. It was followed by the seventh tetralogy: *Hippias Major* and *Hippias Minor*, two very different dialogues (of refutation, according to Thrasyllus), both featuring the sophist of that name; *Ion*, a curious piece on poetic performance; and *Menexenus*, a still more curious parody of a funeral oration, put in the mouth of Pericles' mistress Aspasia.

For the last two tetralogies Thrasyllus reserved some of Plato's major writings. The eighth contained the very brief (and conceivably spurious) *Clitophon*, in which a minor character from the *Republic* plays variations on themes in the *Republic*, the second dialogue in the group, and generally regarded nowadays as Plato's greatest work. This quartet was completed by *Timaeus* and its unfinished sequel *Critias*, no doubt because these dialogues represent themselves as pursuing further the discussions of the *Republic*. The pre-Copernican mathematical cosmology of *Timaeus* no longer attracts readers as it did throughout antiquity, and particularly in the Middle Ages, when the dialogue was for a period the only part of Plato's *œuvre* known to the Latin West. Finally, the ninth tetralogy began with the short *Minos*, a spurious dialogue taking up issues in the massive *Laws*, Plato's longest and probably latest work, which was put next in the group. Then followed *Epinomis*, an appendix to *Laws* already attributed to one of Plato's pupils in antiquity (Philip of Opous, according to a report in Diogenes Laertius, III 37). Last were placed the *Letters*, briefly discussed above.

3 Authenticity and chronology

Thrasyllus rejected from the canon a variety of minor pieces, some of which still survive through the manuscript tradition. Modern judgment concurs with the ancient verdict against them. It also questions or rejects some he thought genuinely Platonic. But we can be fairly sure that we still possess everything Plato wrote for publication.

Attempting to determine the authenticity or inauthenticity of ancient writings is a hazardous business. Egregious historical errors or anachronisms suffice to condemn a work, but except perhaps for the *Eighth Letter*, this criterion gets no purchase on the Platonic corpus. Stylistic analysis of various kinds can show a piece of writing to be untypical of an author's *œuvre*, without thereby demonstrating its inauthenticity: *Parmenides* is a notable example of this. Most of Plato's major dialogues are in fact attested as his by Aristotle. The difficult cases are short pieces such as *Theages* and *Clitophon*, and, most interestingly, three more extended works: the *Seventh Letter*, *Alcibiades I* and *Hippias Major*. Opinion remains divided on them. Some scholars detect crude or sometimes brilliant pastiche of Plato's style; a parasitic relationship with undoubtedly genuine dialogues; a philosophical crassness or a misunderstanding of Platonic positions which betrays the forger's hand. Yet why should Plato not for some particular purpose recapitulate or elaborate things he has said elsewhere? And perhaps he did sometimes write more coarsely or didactically or long-windedly than usual. Such assessments are inevitably matters of judgment, on which intelligent and informed readers will legitimately differ.

Prospects for an absolute chronology of Plato's writings are dim. There are no more than two or three references to datable contemporaneous events in the entire corpus (leaving aside the *Letters*).

Relative chronology is another matter. Some dialogues refer back to others. A number of instances have been mentioned already, but we can add a clear reminiscence of *Meno* in *Phaedo* (72e–73b), and of *Parmenides* in both *Theaetetus* (183e–184a) and *Sophist* (217c). According to one ancient tradition *Laws* was unfinished at Plato's death, and Aristotle informs us that it was written after *Republic* (*Politics* 1264b24–7), to which it appears to allude (see, for example, *Laws* 739a–e). Attempts have sometimes been made to find evidence, whether internal or external, for the existence of early versions of works we possess in different form. One example is the suggestion that Aristophanes' comedy *Ecclesiazousae* or *Assembly of Women* (388 BC) was parodying an early version of book V of *Republic*. But while the idea that Plato may have revised some of his writings is plausible, concrete instances in which such revision is plainly the best explanation of the phenomena are hard to find. Even if they were not, it is unlikely that the consequences for relative chronology would be clear.

For over a century hopes for a general relative chronology of Plato's writings have been pinned on the practice of stylistic analysis. This was pioneered by Lewis Campbell in his edition of *Sophist* and *Politicus*, published in 1867. His great achievement was to isolate a group of dialogues which have in common a number of features (added to by subsequent investigators) that set them apart from all the rest. *Timaeus*, *Critias*, *Sophist*, *Politicus*, *Philebus* and *Laws* turn out to share among other things a common technical vocabulary; a preference for certain particles, conjunctions, adverbs and other qualifiers over alternatives favoured in other dialogues; distinctive prose rhythms; and the deliberate attempt to avoid the combination of a vowel at the end of one word followed by another vowel at the beginning of the next. Since there are good independent reasons for taking *Laws* to be Plato's last work, Campbell's sextet is very likely the product of his latest phase of philosophical activity. Application of the same stylistic tests to the Platonic corpus as a whole, notably by Constantin Ritter, established *Republic*, *Theaetetus* and *Phaedrus* as dialogues which show significantly more of the features most strongly represented in the late sextet than any others. There is general agreement that they must be among the works whose composition immediately precedes that of the *Laws* group, always allowing that *Republic* must have taken several years to finish, and that parts of it may have been written earlier and subsequently revised. *Parmenides* is ordinarily included with these three, although mostly on non-stylistic grounds.

Since Campbell's time there have been repeated attempts by stylometrists to divide the remaining dialogues into groups, and to establish sequences within groups. The heyday of this activity was in the late nineteenth and early twentieth centuries. Since the 1950s there has been a revival in stylistic study, with the use of increasingly sophisticated statistical techniques and the resources of the computer and the database. Secure results have proved elusive. Most scholars would be happy to date *Phaedo*, *Symposium* and *Cratylus* to a middle period of Plato's literary and philosophical work which may be regarded as achieving its culmination in *Republic*. But while this dating is sometimes supported by appeal to stylistic evidence, that evidence is in truth indecisive: the hypothesis of a middle period group of dialogues really rests on their philosophical affinities with *Republic* and their general literary character. The same can be said *mutatis mutandis* of attempts to identify a group assigned to Plato's early period.

The cohesiveness of Campbell's late group has not gone unchallenged. For example, in 1953 G.E.L. Owen mounted what for a while seemed to some a successful attack on his dating of *Timaeus* and *Critias*, on the ground that these dialogues belong philosophically in Plato's middle period. Broadly speaking, however, stylistic studies have helped to establish an agreed chronological framework within which most debates about philosophical interpretation now take place. This is not to say however that there is unanimity about the way Plato's thought developed; and some scholars refuse to assign any importance to the notion of development for understanding his philosophical project or projects in the dialogues.

4 The Platonic dialogue

Who invented the philosophical dialogue, and what literary models might have inspired the invention, are not matters on which we have solid information. We do know that several of Socrates' followers composed what Aristotle calls *Sōkratikoi logoi*, discourses portraying Socrates in fictitious conversations. The only examples which survive intact besides Plato's are by XENOPHON, probably not one of the earliest practitioners of the genre.

One major reason for the production of this literature was the desire to defend Socrates against the charges of irreligion and corrupting young people made at his trial and subsequently in Athenian pamphleteering, as well as the implicit charge of guilt by association with a succession of oligarchic politicians. Thus his devotion to the unstable and treacherous Alcibiades was variously portrayed in, for example, the first of the *Alcibiades* dialogues ascribed to Plato and the now fragmentary *Alcibiades* of Aeschines of Sphettos, but both

emphasized the gulf between Alcibiades' self-conceit and resistance to education and Socrates' disinterested concern for his moral wellbeing. The same general purpose informed the publication of versions of Socrates' speech (his 'apology') before the court by Plato, Xenophon and perhaps others. Writing designed to clear Socrates' name was doubtless a particular feature of the decade or so following 399 BC, although it clearly went on long after that, as in Xenophon's *Memorabilia*. After starting in a rather different vein *Gorgias* turns into Plato's longest and angriest dialogue of this kind. Socrates is made to present himself as the only true politician in Athens, since he is the one person who can give a truly rational account of his conduct towards others and accordingly command the requisite political skill, which is to make the citizens good. But he foresees no chance of acquittal by a court of jurors seeking only gratification from their leaders.

Placing Socrates in opposition to Alcibiades is a way of defending him. Arranging a confrontation between a sophist (Protagoras or Hippias) or a rhetorician (Gorgias) or a religious expert (Euthyphro) or a Homeric recitalist (Ion) and Socrates is a way of exposing their intellectual pretensions, and in most cases their moral shallowness, while celebrating his wit, irony and penetration and permitting his distinctive ethical positions and ethical method to unfold before the reader's eyes. The elenchus (see SOCRATES §§3–4) is by no means the only mode of argument Socrates is represented as using in these fictional encounters. Plato particularly enjoys allowing him to exploit the various rhetorical forms favoured by his interlocutors. But it is easy to see why the dialogue must have seemed to Plato the ideal instrument not only for commemorating like Xenophon Socrates' style of conversation, but more importantly for exhibiting the logical structure and dynamic of the elenchus, and its power in Socrates' hands to demolish the characteristic intellectual postures of those against whom it is deployed.

In these dialogues of confrontation Socrates seldom succeeds in humbling his interlocutors into a frank recognition that they do not know what they thought they knew: the official purpose – simultaneously intellectual and moral – of the elenchus. It would not have been convincing to have him begin to convert historical figures with well-known intellectual positions. The main thing registered by their fictional counterparts is a sense of being manipulated into self-contradiction. In any case, the constructive response to the extraordinary figure of Socrates which Plato really wants to elicit is that of the reader. We have to suppose that, as conversion to philosophy was for Plato scarcely distinguishable from his response to Socrates (devotion to the man, surrender to the spell of his charisma, strenuous intellectual engagement with his thought and the questions he was constantly pursuing), so he conceived that the point of writing philosophy must be to make Socrates charismatic for his readers – to move us to similar devotion and enterprise. In short, the dialogues constitute simultaneously an invitation to philosophy and a critique of its intellectual rivals.

Whatever Plato's other accomplishments or failures as a writer and thinker, one project in which he unquestionably succeeds is in creating a Socrates who gets under the reader's skin (see SOCRATES §7). Plato has a genius for portrayal of character: the 'arrogant self-effacement' of Socrates' persona; the irony at once sincere and insincere; the intellectual slipperiness in service of moral paradox; the nobility of the martyr who loses everything but saves his own soul, and of the hero who stands firm on the battlefield or in face of threats by the authorities; relentless rationality and almost impregnable self-control somehow cohabiting with susceptibility to beautiful young men and their erotic charm. Also important is the ingenious variety of perspectives from which we see Socrates talking and interacting with others. Sometimes he is made to speak to us direct (for example, *Apology*, *Gorgias*). Sometimes Plato invites us to share complicity in a knowing narrative Socrates tells of his own performance (as in *Charmides* and *Protagoras*). Sometimes someone else is represented as recalling an unforgettably emotional occasion when Socrates dominated a whole roomful of people, as in the most powerfully dramatic dialogues of all, *Phaedo* and *Symposium*. Here we have the illusion that Socrates somehow remains himself even though the ideas advanced in them must go beyond anything that the historical Socrates (or at any rate the agnostic Socrates of *Apology*) would have claimed about the soul and its immortality or about the good and the beautiful.

5 The problem of writing

It might seem strange that an original philosopher of Plato's power and stature should be content, outside the *Letters* if some of them are by him, never to talk directly to the reader, but only through the medium of narrative or dramatic fiction, even granted the pleasure he plainly takes in exhibiting his mastery of that medium. This will become less mysterious if we reflect further on Socrates and Socratic questioning. At any rate by the time of the *Meno*, Plato was wanting to suggest that the elenchus presupposes that understanding is not something one person can transmit in any straightforward way to another, but something which has to be worked out

for oneself and recovered from within by recollection. The suggestion is made by means of an example from mathematics, where it is transparently true that seeing the answer to a problem is something that nobody else can do for us, even if Socrates' questions can prompt us to it. The moral we are to draw is that in pressing his interlocutors on what they say they believe, Socrates is merely an intellectual midwife assisting them to articulate for themselves a more coherent and deeply considered set of views, which will ideally constitute the truth.

The Platonic dialogue can be interpreted as an attempt to create a relationship between author and reader analogous to that between Socrates and his interlocutors. Given that that relationship is to be construed in the way indicated in *Meno*, the point of a dialogue will be like that of the elenchus: not to teach readers the truth (it is strictly speaking unteachable), but to provoke and guide them into working at discovering it for themselves. Most of the dialogues of Campbell's late sextet are admittedly more didactic than one would expect on this view of the dialogue, and it is significant that except in *Philebus* Socrates is no longer the main speaker. Yet even here use of the dialogue form can be taken as symbolizing that responsibility for an active philosophical engagement with what Plato has written rests with the reader, as the difficulty and in some cases the methodological preoccupations of most of these works confirms.

In a much discussed passage at the end of *Phaedrus* (275–8), Socrates is made to speak of the limitations of the written word. It can answer no questions, it cannot choose its readers, it gets misunderstood with no means of correcting misunderstanding. Its one worthwhile function is to remind those who know of what they know. By contrast with this dead discourse live speech can defend itself, and will be uttered or not as appropriate to the potential audience. The only serious use of words is achieved when speech, not writing, is employed by dialecticians to sow seeds of knowledge in the soul of the learner. If they commit their thoughts to writing they do so as play (*paidia*). The *Seventh Letter* (341–2) makes related remarks about the writing of philosophy; and at various points in, for example, *Republic*, *Timaeus* and *Laws*, the discussions in which the interlocutors are engaged are described as play, not to be taken seriously.

Interpreters have often taken these written remarks about writing with the utmost seriousness. In particular the Tübingen school of Platonic scholarship has connected them with references, especially in Aristotle, to unwritten doctrines of Plato. They have proposed that the fundamental principles of his philosophy are not worked out in the dialogues at all, but were reserved for oral discussions in the Academy, and have to be reconstructed by us from evidence about the unwritten doctrines. But this evidence is suspect where voluble and elusive when apparently more reliable. There are two star exhibits. First, according to the fourth-century BC music theorist Aristoxenus, Aristotle used to tell of how when Plato lectured on the good he surprised and disappointed his listeners by talking mostly about mathematics (*Harmonics* II, 30.16–31.3). Second, at one point in the *Physics* (209b13–6) Aristotle refers to Plato's 'so-called unwritten teachings'; and the Aristotelian commentators report that Aristotle and other members of the Academy elsewhere wrote more about them. Plato's key idea was taken to be the postulation of the One and the great and the small, or 'indefinite dyad', as principles of all things, including Forms. In his *Metaphysics* (I.6) Aristotle seems to imply that in this theory the Forms were construed in some sense as numbers. It remains obscure and a subject of inconclusive scholarly debate how far the theory was worked out, and what weight we should attach to it in comparison to the metaphysical explorations of the dialogues of Plato's middle and late periods (see for example Guthrie 1975, 1978).

The general issue of how far we can ascribe to Plato things said by interlocutors (principally Socrates) in his dialogues is something which exercises many readers. The position taken here will be that no single or simple view of the matter is tenable: sometimes, for example, Plato uses the dialogue form to work through a problem which is vexing him; sometimes to recommend a set of ideas to us; sometimes to play teasingly with ideas or positions or methodologies without implying much in the way of commitment; and frequently to suggest to us ways we should or should not ourselves try to philosophize. As for the Tübingen school, we may agree with them that when it introduces the Form of the Good the *Republic* itself indicates that readers are being offered only conjectures and images, not the thorough dialectical discussion necessary for proper understanding. But the notions of seriousness and play are less straightforward than they allow. Playing with ideas – that is, trying them out and developing them to see what might work and what will not – is the way new insights in philosophy and science are often discovered. When we meet it in Plato's dialogues it usually seems fun without being frivolous. Nor should we forget that the Platonic dialogue represents itself as a spoken conversation. It seems hard to resist the thought that we are thereby invited to treat his dialogues not as writing so much as an attempt to transcend the limitations of writing. Perhaps the idea is that they can achieve the success

of living speech if treated not as texts to be interpreted (despite Plato's irresistible urge to produce texts devised precisely to elicit attempts at interpretation), but as stimuli to questions we must put principally to ourselves, or as seeds which may one day grow into philosophy in our souls.

6 Early works

There is widespread scholarly agreement that the following are among Plato's earliest writings: *Apology*, *Crito*, *Ion*, *Hippias Minor*, *Laches* and *Charmides*. *Apology*, as we have noted, best fits into the context of the decade following Socrates' death, and so does *Crito*, which explores the question why he did not try to escape from the condemned cell; the others are all short treatments of questions to do with virtue and knowledge, or in the case of *Ion*, with expertise (*technē*), and all are relatively simple in literary structure. The brief *Euthyphro* and the much longer *Protagoras* and *Gorgias* (with which *Menexenus* is often associated) are usually seen as having many affinities with these, and so are put at least fairly early, although here anticipations of the style or content of the mature middle-period dialogues have also been detected. The connections in thought between *Lysis*, *Euthydemus* and *Hippias Major* and middle-period Plato may be argued to be stronger still, even though there remain clear similarities with the dialogues generally accepted as early. We do not know whether Plato wrote or published anything before Socrates' death; *Menexenus* cannot be earlier than 386 BC, *Ion* might be datable to around 394–391 BC, but otherwise we can only guess.

All those listed above fall under the commonly used description 'Socratic dialogues', because they are seen as preoccupied with the thought of the historical Socrates as Plato understood him, in contrast with writings of the middle period, where 'Socrates' often seems to become a vehicle for exploring a more wide-ranging set of ideas (see SOCRATES §2). In the Socratic dialogues discussion is confined almost exclusively to ethical questions, or problems about the scope and credentials of expertise: metaphysics and epistemology and speculation about the nature and powers of the soul are for the most part notable by their absence. Use of the elenchus is prominent in them as it is not, for example, in *Republic* (apart from book I, sometimes regarded as an early work subsequently reused as a preface to the main body of the dialogue). The hypothesis that philosophizing in this style was the hallmark of the historical Socrates is broadly consistent with what we are given to understand about him by Xenophon, Aristotle and Plato's *Apology* – which is usually thought to be particularly authoritative evidence, whether or not it is a faithful representation of what Socrates really said at his trial.

How historical the historical Socrates of the hypothesis actually is we shall never know. The conjecture that many of the Socratic dialogues are early works is likewise only a guess, which gets no secure support from stylometric evidence. None the less the story of Plato's literary and philosophical development to which it points makes such excellent sense that it has effectively driven all rival theories from the field. The placing of individual dialogues within that story remains a matter for controversy; and doubts persist over how far interpretation of Plato is illuminated or obstructed by acceptance of any developmental pattern. With these provisos, the account which follows assumes the existence of a group of early Socratic dialogues in the sense explained.

The convenience of the description 'Socratic dialogues' should not generate the expectation of a single literary or philosophical enterprise in these writings. It conceals considerable variety, for example as between works devoted to articulating and defending the philosophical life and works which problematize Socratic thought as much as they exhibit its attractions. This distinction is not an exhaustive one, but provides useful categories for thinking about some of the key productions of Plato's early period.

7 Apologetic writings

Moral, or indeed existential, choice, to use an anachronistic expression, is the insistent focus of *Apology*. God has appointed Socrates, as he represents it to his judges, to live the philosophical life, putting himself and others under constant examination. The consistency of his commitment to this mission requires him now to face death rather than abandon his practice of philosophy, as he supposes for the sake of argument the court might require him to do. For confronted with the choice between disobeying God (that is, giving up philosophy) and disobeying human dictate (that is, refusing to do so), he can only take the latter option. What governs his choice is justice:

> It is a mistake to think that a man worth anything at all should make petty calculations about the risk of living or dying. There is only one thing for him to consider when he acts: whether he is doing right or wrong, whether he is doing what a good man or a bad man would do.
>
> (*Apology* 28b)

Whether death is or is not a bad thing Socrates says he does not know. He does know that behaving

wrongly and disobeying one's moral superior – whether divine or human – is bad and shameful. The demands of justice, as his conscience (or 'divine sign') interpreted them, had earlier led him to choose the life of a private citizen, conversing only with individuals, rather than the political life: for justice and survival in politics are incompatible. When he did carry out the public obligations of a citizen and temporarily held office, justice again compelled him to choose the dangerous and unpopular course of resisting a proposal that was politically expedient but contrary to the law. As for those with whom he talked philosophy, they too faced a choice: whether to make their main concern possessions and the body, or virtue and the soul; that is, what belongs to oneself, or oneself. And now the judges too must choose and determine what is just as their oath requires of them.

Crito and *Gorgias* continue the theme in different ways. *Crito* has often been found difficult to reconcile with *Apology* when it argues on various grounds (paternalistic and quasi-contractual) that citizens must always obey the law, unless they can persuade it that it is in the wrong. Hence, since the law requires that Socrates submit to the punishment prescribed by the court, he must accept the sentence of death pronounced on him. The higher authority of divine command stressed in *Apology* seems to have been forgotten. Once again, however, the whole argument turns on appeal to justice and to the choices it dictates: we must heed the truth about it, not what popular opinion says; we must decide whether or not we believe the radical Socratic proposition that retaliation against injury or injustice is never right (see SOCRATES §4). *Gorgias*, one of the longest of all the dialogues, ranges over a wide territory, but at its heart is the presentation of a choice. Socrates addresses Callicles, in whose rhetoric Nietzsche saw an anticipation of his ideal of the superman:

> You see that the subject of our arguments – and on what subject should a person of even small intelligence be more serious? – is this: what kind of life should we live? The life which you are now urging upon me, behaving as a *man* should: speaking in the assembly and practising rhetoric and engaging in politics in your present style? Or the life of philosophy?
> (*Gorgias* 5th century BC)

The dialogue devotes enormous energy to arguing that only philosophy, not rhetoric, can equip us with a true expertise which will give us real power, that is power to achieve what we want: the real not the apparent good. Only philosophy can articulate a rational and reliable conception of happiness – which turns out to depend on justice.

8 Laches *and* Charmides

Contrast the works outlined in §7 with *Laches* and *Charmides*, which were very likely conceived as a pair, the one an inquiry into courage, the other into *sōphrosynē* or moderation. Both engage in fairly elaborate scene setting quite absent from *Crito* and *Gorgias*. In both there is concern with the relation between theory and practice, which is worked out more emphatically in *Laches*, more elusively in *Charmides*. For example, in *Laches* Socrates is portrayed both as master of argument about courage, and as an exemplar of the virtue in action – literally by reference to his conduct in the retreat from Delium early in the Peloponnesian War, metaphorically by his persistence in dialectic, to which his observations on the need for perseverance in inquiry draw attention.

A particularly interesting feature of these dialogues is their play with duality. Socrates confronts a *pair* of main interlocutors who clearly fulfil complementary roles. We hear first the views of the more sympathetic members of the two pairs: the general Laches, whom Socrates identifies as his partner in argument, and the young aristocrat Charmides, to whom he is attracted. Each displays behavioural traits associated with the virtue under discussion, and each initially offers a definition in behavioural terms, later revised in favour of a dispositional analysis: courage is construed as a sort of endurance of soul, *sōphrosynē* as modesty. After these accounts are subjected to elenchus and refuted, the other members of the pairs propose intellectualist definitions: according to Nicias (also a general), courage is knowledge of what inspires fear or confidence, while Critias identifies *sōphrosynē* with self-knowledge.

Broad hints are given that the real author of these latter definitions is Socrates himself; and in *Protagoras* he is made to press Protagoras into accepting the same definition of courage. There are also hints that, as understood by their proponents here, this intellectualism is no more than sophistic cleverness, and that neither possesses the virtue he claims to understand. Both are refuted by further Socratic elenchus, and in each case the argument points to the difficulty of achieving an intellectualist account which is not effectively a definition of virtue in general as the simple knowledge of good and bad. *Laches* explicitly raises the methodological issue of whether one should try to investigate the parts of virtue in order to understand the whole or vice versa (here there are clear connections with the main argument of *Protagoras*).

Aristotle was in no doubt that Socrates 'thought all the virtues were forms of knowledge' (*Eudemian Ethics* 1216b6); and many moves in the early

dialogues depend on the assumption that if you know what is good you will *be* good (see SOCRATES §5). But *Laches* and *Charmides* present this Socratic belief as problematical. Not only is there the problem of specifying a unique content for the knowledge with which any particular virtue is to be identified. There is also the difficulty that any purely intellectual specification of what a virtue is makes no reference to the dispositions Charmides and Laches mention and (like Socrates) exemplify. In raising this difficulty Plato is already adumbrating the need for a more complex moral psychology than Socrates', if only to do justice to how Socrates *lived*. If the viewpoints of Laches and Nicias are combined we are not far from the account of courage in *Republic*, as the virtue of the spirited part of the soul, which 'preserves through pains and pleasures the injunctions of reason concerning what is and is not fearful' (442b).

9 Other dialogues of inquiry

In *Protagoras* it is Socrates himself who works out and defends the theory that knowledge is sufficient for virtuous action and that different virtues are different forms of that knowledge (see ARETĒ). He does not here play the role of critic of the theory, nor are there other interlocutors who might suggest alternative perceptions: indeed Protagoras, as partner not adversary in the key argument, is represented as accepting the key premise that (as he puts it) 'wisdom and knowledge are the most powerful forces governing human affairs' (352c–d). It would be a mistake to think that Plato found one and the same view problematic when he wrote *Laches* and *Charmides* but unproblematic when he wrote *Protagoras*, and to construct a chronological hypothesis to cope with the contradiction. *Protagoras* is simply a different sort of dialogue: it displays Socratic dialectic at work from a stance of some detachment, without raising questions about it. *Protagoras* is an entirely different kind of work from *Gorgias*, too: the one all urbane sparring, the latter a deadly serious confrontation between philosophy and political ambition. *Gorgias* unquestionably attacks hedonism, *Protagoras* argues for it, to obtain a suitable premise for defending the intellectualist paradox that nobody does wrong willingly, but leaves Socrates' own commitment to the premise at best ambiguous (see SOCRATES §6). Incommensurabilities of this kind make it unwise to attempt a relative chronology of the two dialogues on the basis of apparent incompatibilities in the positions of their two Socrates.

Space does not permit discussion of *Ion*, a debate about poetry (is it craft or inspiration?), or of *Hippias Minor*, in which Socrates is made to tease us with the paradox – derived from his equation of virtue and knowledge – that someone who *did* do wrong knowingly and intentionally would be better than someone who did it unintentionally through ignorance. Interpretation of *Euthyphro* remains irredeemably controversial. Its logical ingenuity is admired, and the dialogue is celebrated for its invention of one of the great philosophical questions about religion: either we should do right because god tells us to do so, which robs us of moral autonomy, or because it is right god tells us to do it, which makes the will of god morally redundant.

Something more needs to be said about *Lysis* and *Euthydemus* (which share a key minor character in Ctesippus, and are heavy with the same highly charged erotic atmosphere) and *Hippias Major*. They all present Socrates engaging in extended question and answer sessions, although only in *Hippias* is this an elenchus with real bite: in the other dialogues his principal interlocutors are boys with no considered positions of their own inviting refutation. All end in total failure to achieve positive results. All make great formal play with dualities of various kinds. Unusually ingenious literary devices characterize the three works, ranging from the introduction of an *alter ego* for Socrates in *Hippias* to disruption of the argument of the main dialogue by its 'framing' dialogue in *Euthydemus*, at a point where the discussion is clearly either anticipating or recalling the central books of *Republic*. All seem to be principally preoccupied with dialectical method (admittedly a concern in every dialogue). Thus *Hippias* is a study in definitional procedure, applied to the case of the fine or beautiful, *Lysis* a study in thesis and antithesis paralleled in Plato's *œuvre* only by *Parmenides*, and *Euthydemus* an exhibition of the contrast between 'eristic', that is, purely combative sophistical argument, demonstrated by the brothers Euthydemus and Dionysodorus, and no less playful philosophical questioning that similarly but differently ties itself in knots. It is the sole member of the trio which could be said with much conviction to engage – once more quizzically – with the thought of the historical Socrates about knowledge and virtue. But its introduction of ideas from *Republic* makes it hard to rank among the early writings of Plato. Similarly, in *Lysis* and *Hippias Major* there are echoes or pre-echoes of the theory of Forms and some of the causal questions associated with it. We may conclude that these ingenious philosophical exercises – 'gymnastic' pieces, to use the vocabulary of *Parmenides* – might well belong to Plato's middle period.

10 The introduction of Platonism

Needless to say, no explicit Platonic directive survives that encourages us to read *Meno*, *Symposium*

and *Phaedo* together. But there are compelling reasons for believing that Plato conceived them as a group in which *Meno* and *Symposium* prepare the way for *Phaedo*. In brief, in *Meno* Plato introduces his readers to the non-Socratic theory of the immortality of the soul and a new hypothetical method of inquiry, while *Symposium* presents for the first time the non-Socratic idea of a Platonic Form, in the context of a notion of philosophy as desire for wisdom. It is only in *Phaedo* that all these new ideas are welded together into a single complex theory incorporating epistemology, psychology, metaphysics and methodology, and constituting the distinctive philosophical position known to the world as Platonism.

Meno and *Symposium* share two features which indicate Plato's intention that they should be seen as a pair, performing the same kind of introductory functions, despite enormous differences for example in dialogue form, scale and literary complexity. First, both are heavily and specifically foreshadowed in *Protagoras*, which should accordingly be reckoned one of the latest of Plato's early writings. At the end of *Protagoras* (361c) Socrates is made to say that he would like to follow up the inconclusive conversation of the dialogue with another attempt to define what virtue is, and to consider again whether or not it can be taught. This is exactly the task undertaken in *Meno*. Similarly, not only are all the *dramatis personae* of *Symposium* except Aristophanes already assembled in *Protagoras*, but at one point Socrates is represented as offering the company some marginally relevant advice on how to conduct a drinking party – which corresponds exactly to what happens at the party in *Symposium* (347c–348a).

Second, both *Meno* and *Symposium* are exceedingly careful not to make Socrates himself a committed proponent either of the immortality of the soul or of the theory of Forms. These doctrines are ascribed respectively to 'priests and priestesses' (*Meno*) and to one priestess, Diotima, in particular (*Symposium*); in *Meno*Socrates says he will not vouch for the truth of the doctrine of immortality, in *Symposium* he records Diotima's doubts as to whether he is capable of initiation into the mysteries (a metaphor also used of mathematics in *Meno*) which culminate in a vision of the Form of the Beautiful. In *Symposium* these warning signs are reinforced by the extraordinary form of the dialogue: the sequence of conversations and speeches it purports to record are nested inside a Chinese box of framing conversations, represented as occurring some years later and with participants who confess to inexact memory of what they heard.

Phaedo for its part presupposes *Meno* and *Symposium*. At 72e–73b *Meno*'s argument for the immortality of the soul is explicitly recalled, while the Form of Beauty is regularly mentioned at the head of the lists of the 'much talked about' Forms which *Phaedo* introduces from time to time (for example, 75c, 77a, 100b). It is as though Plato relies upon our memory of the much fuller characterization of what it is to be a Form supplied in *Symposium*. Unlike *Meno* and *Symposium*, *Phaedo* represents Socrates himself as committed to Platonist positions, but takes advantage of the dramatic context – a discussion with friends as he waits for the hemlock to take effect – and makes him claim prophetic knowledge for himself like a dying swan (84e–85b). The suggestion is presumably that Platonism is a natural development of Socrates' philosophy even if it goes far beyond ideas about knowledge and virtue and the imperatives of the philosophical life to which he is restricted in the early dialogues.

11 Meno

Meno is a dialogue of the simplest form and structure. It consists of a conversation between Socrates and Meno, a young Thessalian nobleman under the spell of the rhetorician Gorgias, interrupted only by a passage in which Socrates quizzes Meno's slave, and then later by a brief intervention in the proceedings on the part of Anytus, Meno's host and one of Socrates' accusers at his trial. The dialogue divides into three sections: an unsuccessful attempt to define what virtue is, which makes the formal requirements of a good definition its chief focus; a demonstration in the face of Meno's doubts that successful inquiry is none the less possible in principle; and an investigation into the secondary question of whether virtue can be taught, pursued initially by use of a method of hypothesis borrowed from mathematics. Although the ethical subject matter of the discussion is thoroughly Socratic, the character and extent of its preoccupation with methodology and (in the second section) epistemology and psychology are not. Nor is *Meno*'s use of mathematical procedures to cast light on philosophical method; this is not confined to the third section. Definitions of the mathematical notion of shape are used in the first section to illustrate for example the principle that a definition should be couched in terms that the interlocutor agrees are already known. And the demonstration of an elenchus with a positive outcome which occupies the second is achieved with a geometrical example.

It looks as though Plato has come to see in the analogy with mathematics hope for more constructive results in philosophy than the Socratic elenchus generally achieved in earlier dialogues. This is a moral which the second and third sections of *Meno* make particularly inviting to draw. In the second

Socrates is represented as setting Meno's untutored slave boy a geometrical problem (to determine the length of the side of a square twice the size of a given square) and scrutinizing his answers by the usual elenctic method. The boy begins by thinking he has the answer. After a couple of mistaken attempts at it he is persuaded of his ignorance. So far so Socratic. But then with the help of a further construction he works out the right answer, and so achieves true opinion, which it is suggested could be converted into knowledge if he were to go through the exercise often. The tacit implication is that if elenchus can reach a successful outcome in mathematics, it ought to be capable of it in ethics too.

None the less, and perhaps significantly, Socrates does not press or indeed even articulate that point; direct engagement with the original problem of what virtue is is in fact abandoned at this juncture, and the discussion turns to the issue of its teachability, and to the method of hypothesis. Here the idea is that instead of investigating the truth of proposition *p* directly 'you hit upon another proposition *h* ('the hypothesis'), such that *p* is true if and only if *h* is true, and then investigate the truth of *h*, undertaking to determine what would follow (quite apart from *p*) if *h* were true and, alternatively, if it were false' (as formulated by Vlastos). After illustrating this procedure with an exceedingly obscure geometrical example, Socrates makes a lucid application of it to the ethical problem before them, and offers the Socratic thesis that virtue is knowledge as the hypothesis from which the teachability of virtue can be derived. The subsequent examination of this hypothesis comes to conclusions commentators have found frustratingly ambiguous. But the survival and development of the hypothetical method in *Phaedo* and *Republic* are enough to show Plato's conviction of its philosophical potential.

The slave boy episode is originally introduced by Socrates as a proof of something much more than the possibility of successful inquiry. The suggestion is that the best explanation of that possibility is provided by the doctrine of the immortality of the soul, a Pythagorean belief which makes the first of its many appearances in Plato's dialogues in *Meno* (see PSYCHĒ; PYTHAGORAS; PYTHAGOREANISM). More specifically, the idea as Socrates presents it is that the soul pre-exists the body, in a condition involving conscious possession of knowledge. On entry into the body it forgets what it knows, although it retains it as latent memory. Discovery of the sort of a priori knowledge characteristic of mathematics and (as Plato supposes) ethics is a matter of recollecting latent memory. This is just what happens to the slave boy: Socrates does not impart knowledge to him; he works it out for himself by recovering it from within. Once again, although the Socrates of *Meno* does not in the end subscribe to belief in learning as recollection of innate knowledge, it is embraced without equivocation in *Phaedo*, as also in the later *Phaedrus*. But *what* exactly is recollected? *Phaedo* will say: knowledge of Forms. *Meno* by contrast offers no clues. The introduction of the theory of Forms is reserved for *Symposium*.

12 Symposium

Symposium has the widest appeal of all Plato's writings. No work of ancient Greek prose fiction can match its compulsive readability. Plato moves through a rich variety of registers, from knockabout comedy and literary parody to passages of disturbing fantasy or visionary elevation, culminating in a multiply paradoxical declaration of love for Socrates put in the mouth of a drunken Alcibiades. Love (*erōs*) is the theme of the succession of *encōmia* or eulogies delivered at the drinking party (*symposion*) hosted by the playwright Agathon: not sublimated 'Platonic' love between the sexes, but the homoerotic passion of a mature man for a younger or indeed a teenager. This continues until Aristophanes (one of the guests) and Socrates broaden and transform the discussion. Socrates' speech, which is a sort of anti-eulogy, develops a general theory of desire and its relation to beauty, and it is in this context that the idea of an eternal and changeless Form makes its first unequivocal appearance in Plato's *œuvre*. Thus Plato first declares himself a metaphysician not in a work devoted to philosophical argument, but in a highly rhetorical piece of writing, albeit one in which fashionable models of rhetoric are subverted.

Love and beauty are first connected in some of the earlier *encōmia*, and notably in Agathon's claim that among the gods 'Love is the happiest of them all, for he is the most beautiful and best' (195a). This thesis is subjected to elenchus by Socrates in the one argumentative section of the dialogue. Agathon is obliged to accept that love and desire are necessarily love and desire *for something*, namely, something they are in need of. Following his concession Socrates argues that beauty is not what love possesses but precisely the thing it is in need of. This argument constitutes the key move in the philosophy of the dialogue, which Plato elaborates in various ways through the medium of Diotima, the probably fictitious priestess from whom Socrates is made to claim he learned the art of love in which he has earlier (177d) claimed expertise. First she tells a myth representing Love as the offspring of poverty and resource, and so – according to her

interpretation – occupying the dissatisfied intermediate position between ignorance and wisdom which characterizes philosophy: hence presumably the explanation of Socrates' claim to be an expert in love, since the pursuit of wisdom turns out to be the truest expression of love. Then she spells out the theoretical basis for this intellectualist construction of what love is. The theory has rightly been said to combine 'a psychology that is strictly or loosely Socratic with a metaphysics that is wholly Platonic' (see Price, *Mental Conflict* 1995).

This psychology holds that a person who desires something wants not so much the beautiful as the good, or more precisely happiness conceived as permanent possession of the good. Love is a particular species of desire, which occurs when perception of beauty makes us want to reproduce. (Socrates is made to express bafflement at this point: presumably an authorial device for indicating that Diotima's line of thought is now moving beyond anything Plato considered strictly Socratic.) Diotima goes on to explain that reproduction is the way mortal animals pursue immortality, interpreted in its turn in terms of the longing for permanent possession of good with which she has just identified desire. Other animals and many humans are content with physical reproduction, but humans are capable of *mental* creation when inspired by a beautiful body, and still more by a beautiful soul or personality. This is how the activities of poets and legislators and the virtuous are to be understood.

Perhaps Plato thought these ideas, although no longer Socratic, provided a convincing explanation of the drive which powered Socrates' philosophical activity in general, and made him spend so much time with beautiful young men in particular. However that may be, in what follows he has Diotima speak of greater mysteries which 'I do not know whether you [that is, Socrates] would be able to approach'. These are the subject of a lyrical account of how a true lover moves step by step from preoccupation with the beauty of a single beloved, to appreciating that there is one and the same beauty in all bodies and so loving them all, and then to seeing and loving beauty in souls or personalities and all manner of mental creations, until he 'turns to the great sea of beauty, and gazing upon this gives birth to many gloriously beautiful ideas and theories, in unstinting love of wisdom [that is, philosophy]' (210d). The final moment of illumination arrives when the philosopher-lover grasps the Beautiful itself, an experience described as the fulfilment of all earlier exertions. Unlike other manifestations of beauty the Form of the Beautiful is something eternal, whose beauty is not qualified in place or time or relation or respect. It is just the one sort of thing it is, all on its own, whereas other things that are subject to change and decay are beautiful by participation in the Form. Only someone who has looked upon it will be capable of giving birth not to images of virtue (presumably the ideas and theories mentioned a little earlier), but to virtue itself, and so achieving immortality so far as any human can.

It is striking that the doctrine of the immortality of the soul forms no part of Diotima's argument. If we assume the scholarly consensus that *Symposium* postdates *Meno*, this poses something of a puzzle. One solution might be to suppose that, although *Meno* presents the doctrine, Plato is himself not yet wholly convinced of its truth, and so gives it no role in his account of the desire for immortality in *Symposium*. This solution might claim support from the fact that *Phaedo* takes upon itself the task of arguing the case for the immortality of the soul much more strenuously than in *Meno*, and in particular offers a much more careful and elaborate version of the argument from recollection. Additionally or alternatively, we may note that when Plato presents the doctrine of the immortality of the soul in the dialogues, he always treats it as something requiring explicit proof, unlike the theory of Forms, which generally figures as a hypothesis recommending itself by its explanatory power or its ability to meet the requirements of Plato's epistemology. Since Diotima's discourse is not constructed as argument but as the explication of an idea, it is not the sort of context which would readily accommodate the kind of demonstration Plato apparently thought imperative for discussion of the immortality of the soul.

13 Phaedo

The departure point for *Phaedo*'s consideration of the fate of the soul after death is very close to that idea of love as desire for wisdom which Diotima offers at the start of her speech in *Symposium*. For Socrates starts with the pursuit of wisdom, which he claims is really a preparation for death. This is because it consists of an attempt to escape the restrictions of the body so far as is possible, and to purify the soul from preoccupation with the senses and physical desires so that it can think about truth, and in particular about the Forms, which are accessible not to sense perception but only to thought. Pure knowledge of anything would actually require complete freedom from the body. So given that death is the separation of soul from body, the wisdom philosophers desire will be attainable in full only when they are dead. Hence for a philosopher death is no evil to be feared, but something for which the whole of life has been a training. The unbearably powerful death scene at

the end of the dialogue presents Socrates as someone whose serenity and cheerfulness at the end bear witness to the truth of this valuation.

Symposium implied that a long process of intellectual and emotional reorientation was required if someone was to achieve a grasp of the Form of Beauty. *Phaedo* has sometimes been thought to take a different view: interpreters may read its argument about recollecting Forms as concerned with the general activity of concept formation in which we all engage early in life. In fact the passage restricts recollection of Forms to philosophers, and suggests that the knowledge they recover is not the basic ability to deploy concepts (which Plato seems in this period to think a function of sense experience), but hard-won philosophical understanding of what it is to be beautiful or good or just. The interlocutors voice the fear that once Socrates is dead there will be nobody left in possession of that knowledge; and the claim that pure knowledge of Forms is possible only after death coheres with the *Symposium* account very well, implying as it does that the path to philosophical enlightenment is not just long but a journey which cannot be completed in this life.

The proposal that the soul continues to exist apart from the body after death is immediately challenged by Socrates' interlocutors. Much of the rest of *Phaedo* is taken up with a sequence of arguments defending that proposal and the further contention that the soul is immortal, pre-existing the body and surviving its demise for ever. The longest and most ambitious of these arguments is the last of the set. It consists in an application of the method of hypothesis, which is explained again in a more elaborate version than that presented in *Meno*. The hypothesis chosen is the theory of Forms, or rather the idea that Forms function as explanations or causes of phenomena: beautiful things are beautiful by virtue of the Beautiful, large things large by virtue of the Large, and so on. Socrates is made to represent his reliance on this apparently uninformative or 'safe and simple' notion of causation as a position he has arrived at only after earlier intellectual disappointments: first with the inadequacies of Presocratic material causes, then with the failure of Anaxagoras' promise of a teleological explanation of why things are as they are (see Anaxagoras).

He soon goes on to argue however that the hypothesis can be used to generate a more sophisticated model of causation. Instead of proposing merely that (for example) hot things are hot by virtue of the Hot, we may legitimately venture the more specific explanation: 'Hot things are hot by virtue of fire', provided that it is true that wherever fire exists, it always heats things in its vicinity, being itself hot and never cold. After elaborating this point Socrates is ready to apply the model to the case of life and soul. By parity of reasoning, we may assert that living things are alive not just in virtue of life, but in virtue of soul, given that wherever soul exists it makes things it occupies alive, being itself alive and never dead. From this assertion there appears to follow the conclusion whose derivation is the object of the exercise: if soul is always alive and never dead, it must be immortal (that is, incapable of death) and so imperishable.

Phaedo, like *Republic*, ends with a sombre myth of last judgment and reincarnation, designed primarily to drive home the moral implications of Plato's distinctive version of soul–body dualism. It reminds us of the Pythagorean origins of the doctrine of the immortality of the soul. Yet the Platonism of *Phaedo* owes a great deal also to the metaphysics of Parmenides. Both here and in *Symposium* the characterization of Forms as simple eternal beings, accessible only to thought, not the senses, and the contrast both dialogues make with the changing and contradictory world of phenomena, are couched in terms borrowed from Parmenides and the Eleatic tradition which he inaugurated. Platonism can accordingly be seen as the product of an attempt to understand a fundamentally Socratic conception of philosophy and the philosophical life in the light of reflection on these two powerful Presocratic traditions of thought, using the new methodological resources made available by geometry.

14 Republic

Republic is misleadingly titled. The Greek name of the dialogue is *Politeia*, which is the standard word for constitution or ordering of the political structure: 'political order' would give a better sense of what Plato has in mind. There is a further and deeper complication. Once you start reading the dialogue you find that it is primarily an inquiry into justice, conceived as a virtue or moral excellence of individual persons. The philosophical task it undertakes is the project of showing that justice so conceived is in the best interests of the just person, even if it brings nothing ordinarily recognizable as happiness or success, or indeed (as with the sentence of death passed on Socrates) quite the opposite. Thus *Republic* carries forward the thinking about justice begun in early dialogues such as *Apology*, *Crito* and *Gorgias*. Why, then, the title's suggestion that it is a work of political rather than moral philosophy?

One way of answering this question is to attend to the formal structure of *Republic*. After book I, an inconclusive Socratic dialogue which none the less introduces, particularly in the conversation with

Thrasymachus, many of the themes pursued in the rest of the work, the interlocutors agree to take an indirect approach to the problem of individual justice: they will consider the nature of justice and injustice in the *polis*, that is the (city-)state, in the hope that it will provide an illuminating analogy. Books II–IV spell out the class structure required in a 'good city'. It is suggested that in such a state political justice consists in the social harmony achieved when each class (economic, military, governing) performs its own and only its own function. This model is then applied to the individual soul (see PSYCHĒ). Justice and happiness for an individual are secured when each of the parts of the soul (appetite, emotion, reason) performs the role it should in mutual harmony. In working out the idea of psychic harmony, Plato formulates a conception of the complexity of psychological motivation, and of the structure of mental conflict, which leaves the simplicities of Socratic intellectualism far behind, and one which has reminded interpreters of Freudian theory, particularly in books VIII–IX. Here he examines different forms of *un*just political order (notably oligarchy, democracy and tyranny) and corresponding conditions of order, or rather increasing *dis*order, in the soul.

Political theory therefore plays a large part in the argument of the dialogue, even though the ultimate focus is the moral health of the soul, as is confirmed by the conclusion of book IX. Socrates suggests that it may not matter whether we can actually establish a truly just political order, provided we use the idea of it as a paradigm for founding a just city within our own selves.

This account of *Republic* omits the central books V–VII. These explore the notion of political order much further than is necessary for the purposes of inquiry into individual justice. This is where Plato develops the notion of a communistic governing class, involving the recruitment of talented women as well as men, the abolition of the family, and institution of a centrally controlled eugenic breeding programme. And it is where, in order to meet the problem of how the idea of the just city he has been elaborating might ever be put into practice, he has Socrates introduce philosopher-rulers:

> Unless either philosophers rule in our cities or those whom we now call rulers and potentates engage genuinely and adequately in philosophy, and political power and philosophy coincide, there is no end, my dear Glaucon, to troubles for our cities, nor I think for the human race.
>
> (*Republic* 473c–d)

What Plato perhaps has most in mind when he makes Socrates speak of 'troubles' is as well as civil war the corruption he sees in all existing societies. As he acknowledges, this makes the emergence of an upright philosopher-ruler an improbability – and incidentally leaves highly questionable the prospects of anyone but a Socrates developing moral order within the soul when society without is infected with moral disorder.

Here we touch on another broadly political preoccupation of *Republic*, worked out at various places in the dialogue. It offers among other things a radical critique of Greek cultural norms. This is highlighted in the censorship of Homer proposed in books II and III, and in the onslaught on the poets, particularly the dramatists, in book X, and in their expulsion from the ideal city. But these are only the more memorable episodes in a systematic attack on Greek beliefs about gods, heroes and the departed, on the ethical assumptions underlying music, dance and gymnastics (see MIMĒSIS), and again erotic courtship, and on medical and judicial practice. *Republic* substitutes its own austere state educational programme, initially focused on the training of the emotions, but subsequently (in books VI and VII) on mathematics and philosophy. Plato sees no hope for society or the human race without a wholesale reorientation, fostered by an absolute political authority, of all the ideals on which we set our hearts and minds.

Republic itself is written in such a way as to require the reader to be continually broadening perspectives on the huge range of concerns it embraces, from the banalities of its opening conversation between Socrates and the aged Cephalus to its Platonist explication of the very notion of philosophy in the epistemology and metaphysics of books V–VII. At the apex of the whole work Plato sets his presentation of the Form of the Good, as the ultimate goal of the understanding that philosophy pursues by use of the hypothetical method. The dialogue offers a symbol of its own progress in the potent symbol of the cave. We are like prisoners chained underground, who can see only shadows of images flickering on the wall. What we need is release from our mental shackles, and a conversion which will enable us gradually to clamber out into the world above and the sunlight. For then, by a sequence of painful reorientations, we may be able to grasp the Good and understand how it explains all that there is.

15 Critical dialogues

Parmenides is that rare phenomenon in philosophy: a self-critique. Plato here makes his own theory of Forms the subject of a penetrating scrutiny which today continues to command admiration for its ingenuity and insight. *Theaetetus* (datable to soon

after 369 BC) also reverts to Plato's critical manner. It applies an enriched variant of the Socratic elenchus to a sequence of attempts to define knowledge. The confidence of *Phaedo* and *Republic* that Platonist philosophers are in possession of knowledge and can articulate what it consists in is nowhere in evidence, except in a rhetorical digression from the main argument. Methodological preoccupations are dominant in both works. *Parmenides* suggests that to defend the Forms against its critique, one would need to be much more practised in argument than is their proponent in this dialogue (a young Socrates fictively encountering a 65 year-old Parmenides and a middle-aged Zeno). And it sets out a specimen of the sort of exercise required, running to many pages of purely abstract reasoning modelled partly on the paradoxes of ZENO OF ELEA, partly on Parmenides' deductions in the Way of Truth (see PARMENIDES). *Theaetetus* likewise presents itself, initially more or less explicitly, later implicitly, as a model of how to go about testing a theory without sophistry and with due sympathy. While the conclusions achieved by this 'midwifery' – as Socrates here calls it – are as devastatingly negative as in the early dialogues, we learn much more philosophy along the way. Many readers find *Theaetetus* the most consistently rewarding of all the dialogues.

A sketch of the principal concerns of the two dialogues will bring out their radical character. *Parmenides* raises two main questions about Forms. First, are there Forms corresponding to every kind of predicate? Not just *one* and *large*, or *beautiful* and *just*, familiar from the middle period dialogues, but *man* and *fire*, or even *hair* and *dirt*? Socrates is represented as unclear about the issue. Second, the idea that other things we call for example 'large' or 'just' are related to the Form in question by participation is examined in a succession of arguments which seek to show that, however Forms or the participation relation are construed, logical absurdities of one kind or another result. The most intriguing of these has been known since Aristotle as the Third Man: if large things are large in virtue of something distinct from them, namely the Form of Large, then the Large itself and the other large things will be large in virtue of *another* Form of Large – and so on *ad infinitum*.

Theaetetus devotes much of its space to considering the proposal that knowledge is nothing but sense perception, or rather to developing and examining two theories with which that proposal is taken to be equivalent: the view of Protagoras that truth is relative, since 'man is the measure of all things', and that of Heraclitus that everything is in flux, here considered primarily in application to the nature of sense perception. The dialogue is home to some of Plato's most memorable arguments and analogies. For example, Protagoreanism is attacked by the brilliant (although perhaps flawed) self-refutation argument: if man is the measure of *all* things, then the doctrine of the relativity of truth is itself true only in so far as it is believed to be true; but since people in general believe it to be false, it must be false. The next section of *Theaetetus* worries about the coherence of the concept of false belief. Here the soul is compared to a wax tablet, with false belief construed as a mismatch between current perceptions and those inscribed on the tablet, or again to an aviary, where false belief is an unsuccessful attempt to catch the right bird (that is, piece of knowledge). In the final section the interlocutors explore the suggestion that knowledge must involve the sort of complexity that can be expressed in a *logos* or statement. Socrates' 'dream' that such knowledge must be built out of unknowable simples fascinated WITTGENSTEIN (§5), who saw in it an anticipation of the theory of his *Tractatus*.

Are we to infer that in opening or reopening questions of this kind Plato indicates that he is himself in a real quandary about knowledge and the Forms? Or is his main target philosophical complacency in his readers, as needing to be reminded that no position is worth much if it cannot be defended in strenuous argument? Certainly in the other two dialogues grouped here with *Parmenides* and *Theaetetus* the theory of Forms is again in evidence, presented as a view the author is commending to the reader's intellectual sympathies. *Cratylus* is a work whose closest philosophical connections are with *Theaetetus*, although its relative date among the dialogues is disputed. It is a pioneering debate between rival theories of what makes a word for a thing the right word for it: convention or, as Cratylus holds, a natural appropriateness – sound somehow mirroring essence. Underlying Cratylus' position is an obscurely motivated commitment to the truth of Heracliteanism. For present purposes what is of interest is the final page of the dialogue, which takes the theory of Forms as premise for an argument showing that the idea of an absolutely universal Heraclitean flux is unsustainable. As for *Phaedrus*, it contains one of the most elevated passages of prose about the Forms that Plato ever wrote.

The context is an exemplary rhetorical exercise in which *Symposium*'s treatment of the philosophical lover's attraction to beauty is reworked in the light of Republic's tripartition of the soul. Subsequently Plato has Socrates dismiss the speech as 'play', useful only for the methodological morals about rhetorical procedure we happen to be able to derive from it – together with a preceding denunciation of love by

Socrates, capping one by his interlocutor Phaedrus – if we are dialecticians. This comment has led some readers to conjecture that Phaedrus accordingly marks Plato's formal leave-taking of the theory of Forms: in retrospect he sees it more as rhetoric than as philosophy or dialectic, which will henceforward confine itself to something apparently less inspiring – the patient, thorough, comprehensive study of similarities and differences. Yet *Phaedrus* is pre-eminently a dialogue written not to disclose its author's mind, but to make demands on that of the sophisticated reader. Perhaps Socrates' great speech on the philosophical lover is 'play' not absolutely, but only relative to the controlling and unifying preoccupation of the dialogue, which is to work through a fresh examination of rhetoric, going beyond Gorgias in explaining how it can be a genuine form of expertise, based on knowledge of truth and variously geared to the various psychological types to which oratory addresses itself. We might speculate that Plato writes the speech as he does precisely because he thinks or hopes many of his readers will be of a type persuadable to the philosophical life by its vision of the soul's desire for the Beautiful.

16 Later dialogues

The theory of Forms also figures prominently in *Timaeus*. *Timaeus* is Plato's one venture into physical theory, and appropriately has in the Italian Greek Timaeus someone other than Socrates as main speaker. It is presented as an introduction to the story of Atlantis, allegedly an island power defeated by the prehistoric Athenians, and mentioned only by Plato among the classical Greek authors. The conflict between Atlantis and Athens was to be the subject of *Critias*, conceived as a dialogue that would demonstrate the political philosophy of *Republic* in practice. But *Critias* was never completed, so *Timaeus* stands as an independent work.

The argument of *Timaeus* is based on the premise that the universe is not eternal but created – although debate has raged from antiquity onwards whether this means created in time, or timelessly dependent on a first cause. From the order and beauty of the universe Plato infers a good creator or craftsman (*dēmiourgos*), working on pre-existing materials (with their own random but necessary motions) from an eternal blueprint encoding life and intelligence: namely, the Form of Animal. The greater part of *Timaeus* consists in an account of how first the universe (conceived of as a living creature), then humans, are designed from the blueprint for the best. Much use is made of mathematical models, for example for the movements of the heavenly bodies and the atomistic construction of the four elements from triangular surfaces. The account is presented as inevitably only a 'likely story', incapable of the irrefutable truth of metaphysics.

There is no more austere or profound work of metaphysics in Plato's *œuvre* than *Sophist*. Like many of the post-*Republic* dialogues it is 'professional' philosophy, probably written primarily for Plato's students and associates in the Academy. The style of *Sophist* and the remaining works to be discussed is syntactically tortuous and overloaded with abstraction and periphrasis; they are altogether lacking in literary graces or dramatic properties which might commend them to a wider readership. *Sophist*'s main speaker is a stranger from Elea, symbolizing the Parmenidean provenance of the problem at the heart of the long central section of the dialogue: how is it possible to speak of what is not (see PARMENIDES)? This puzzle is applied for example both to the unreality of images and to falsehood, understood as what is not the case. The solution Plato offers required some revolutionary moves in philosophical logic, such as the explicit differentiation of identity from predication, and the idea that subject and predicate play different roles in the syntax of the sentence. These innovations and their bearing on analysis of the verb 'to be' have made *Sophist* the subject of some of the most challenging writing on Plato in the twentieth century.

The companion dialogue *Politicus* or *Statesman* addresses more squarely than *Republic* did the practical as distinct from the theoretical knowledge of the ideal statesman. Its contribution to this topic consists of three major claims. First is the rejection of the sovereignty of law. Plato has nothing against law as a convenient but imprecise rule of thumb in the hands of an expert statesman, provided it does not prevent him using his expertise. Making law sovereign, on the other hand, would be like preferring strict adherence to a handbook of navigation or a medical textbook to the judgment of the expert seafarer or doctor. If you have no such expert available, a constitution based on adherence to law is better than lawlessness, but that is not saying much. What law cannot do that expert rulers can and must is judge the *kairos*: discern the right and the wrong 'moment' to undertake a great enterprise of state. This proposition follows from the second of Plato's key claims, which is represented as one true of all practical arts: real expertise consists not of measuring larger and smaller, but in determining the norm between excess and defect – a notion which we ordinarily think more Aristotelian than Platonic (see ARISTOTLE §22), although it recurs in a different guise in *Philebus*. Finally, Plato thinks we shall only get our thinking straight on this as on any matter if we find

the right – usually homely – model. *Statesman* makes the statesman a sort of weaver. There are two strands to the analogy. First, like weaving statesmanship calls upon many subordinate skills. Its job is not to be doing things itself, but to control all the subordinate functions of government, and by its concern for the laws and every other aspect of the city weave all these strands together. Second, the opposing temperaments of the citizens are what most need weaving together if civil strife is to be avoided, and (as in *Republic*) expert rulers will use education and eugenics to that end.

Statesman shares themes with both *Philebus* and *Laws*. *Philebus* is the one late dialogue in which Socrates is principal speaker, as befits its ethical topic: the question whether pleasure or understanding is the good, or at least the more important ingredient in the good life. After so much insistence in middle-period dialogues on the Form as a unity distinct from the plurality of the phenomena, it comes as a shock to find Socrates stressing at the outset that there is no merit in reiterating that pleasure or understanding is a unity. The skill resides in being able to determine what and how many forms of understanding and pleasure there are. What *Philebus* goes on to offer next is a model for thinking about how any complex structure is produced, whether a piece of music or the universe itself. It requires an intelligent cause creating a mixture by imposing limit and proportion on something indeterminate. This requirement already indicates the main lines of the answer to our problem, at any rate, if it is accepted that pleasure is intrinsically indeterminate. Clearly intelligence and understanding will be shaping forces in the good life, but pleasures are only admissible if suitably controlled. At the adjudication at the end of the dialogue, this is just the result we get. The majority of the many forms of pleasure defined and examined in the course of the dialogue are rejected. They do not satisfy the criteria of measure and proportion which are the marks of the good.

17 Laws

The vast *Laws* is in its way the most extraordinary of all Plato's later writings, not for its inspiration (which flags) but for its evidence of tireless fascination with things political. Its relation to *Republic* and *Statesman* has been much debated. What is clear is that Plato is legislating – through the last eight of its twelve long books – for a second best to the ideal state and ideal statesman of *Republic*, with greater zeal than *Statesman* might have led one to expect. Is this because he has lost faith in those ideals, which still seemed alive in *Statesman* at least as ideals? That view is in danger of overlooking *Republic*'s own indication that it would be wrong to expect in practice anything but an approximation of the ideal.

And an approximation is precisely what the *Laws* presents. Communistic institutions are abandoned, but land holdings are to be equalized to guard against the division between rich and poor which *Republic* saw as the most severe threat to social harmony, and land is to be used as though it were the common property of the whole city. The family is reinstated, but women are not therefore regarded as confined to domestic concerns – they are still to be regarded as half of the city's whole human resource. Educational provisions are given even greater prominence than in *Republic*. They deal explicitly with what *Republic* left largely undiscussed: the irrationality of human nature and the prospects for bringing it under rational control.

If the ideal city of *Republic* is a community shaped and governed by philosophy, *Laws* founds the second-best state on religion. The very first word of the whole work is 'God', and in one way or another religion not philosophy dominates the discussion. The interlocutors are pious elderly men, two of them from the cultural backwaters of Sparta and Crete and without any prior experience of philosophy at all. Together with a more philosophically sophisticated Athenian Stranger they are engaged on a journey to the shrine of Zeus on Mount Ida in Crete, making this the only Platonic dialogue set outside Athens. The city whose constitution and laws they are represented as establishing is to be a theocracy; and the first thing its original settlers are to understand is the need for all their conduct to be governed by consideration of divine justice. In a famous anti-Protagorean phrase they are instructed that 'God is the measure of all things'.

It is already clear by this stage (Book IV) that what Plato has in mind here is not undiluted traditional religion. The theological vocabulary employed is mainly the language of Orphic and Pythagorean rationalized religion; and by theocracy Plato indicates that he means the rule of reason as embodied in law. Moreover, when the Athenian Stranger turns next to consider the principles of legislation, he introduces a novel idea which perhaps constitutes the most interesting proposal in the dialogue. It is the notion of a 'prelude' to a law, which is the attempt the legislator should make to *persuade* citizens, albeit not always by rational means, of the necessity of the prescriptions of the law itself. Here is a theme which relates interestingly to conceptions of reason, necessity and persuasion found in several other dialogues, notably *Republic* and *Timaeus*. In due course the Athenian Stranger will give a reasoned justification of the religious

assumptions which underpin his whole approach to legislation. In Book X, presented as an extended 'prelude' to laws against impiety, Plato imagines an atheist challenge to the whole religious framework of his enterprise, and in response develops an unequivocally philosophical argument for a natural theology which posits soul as divine first cause of motion and change in the universe.

Plato seems to have wanted two things above all of the discourse he developed in the *Laws*: first, that it should reflect and embody a sense of a transcendent moral framework for political and social existence; second, that it should be capable of being persuasive –because *inter alia* generally intelligible – to a population at large, not to just an intellectual elite. As he judged the matter, it was religious discourse, reformed and redirected as necessary, which could most palpably meet these two requirements.

18 Plato's influence

Plato's influence pervades much of subsequent Western literature and thought. Aristotle was among those who came to listen to him in the 'school' he founded in the Academy; and a great deal of Aristotle's work is conceived in explicit or implicit response to Plato. Other philosophical traditions flourished after Aristotle's time in the last centuries BC, and the Academy of the period read Plato through sceptical spectacles. But from the first century AD onwards Platonism in various forms, often syncretistic, became the dominant philosophy of the Roman Empire (see Platonism, Early and Middle), especially with the rise of Neoplatonism in late antiquity (see Neoplatonism). Some of the Fathers of the early Greek Church articulated their theologies in Platonist terms; and through Augustine in particular Plato shaped, for example, the Western Church's conception of time and eternity (see Patristic philosophy). A Neoplatonist version of him prevailed among the Arabs.

With the translation of Plato into Latin in the high Middle Ages and the revival of Greek studies in the Renaissance, Platonism (again in a Neoplatonic guise) once more gripped the minds of learned thinkers in the West, for example at the Medici court in fifteenth-century Florence. But none of the great philosophers of the modern era has been a Platonist, even if Plato was an important presence in the thought of a Leibniz or a Hegel or a Russell. Probably he has never been studied more intensively than in the late twentieth and early twenty-first centuries. Thanks to the availability of cheap translations in every major language and to his position as the first great philosopher in the Western canon, he figures in most introductory courses offered every year to tens of thousands of students throughout the developed world.

MALCOLM SCHOFIELD

PLATONISM, RENAISSANCE

Though it never successfully challenged the dominance of Aristotelian school philosophy, the revival of Plato and Platonism was an important phenomenon in the philosophical life of the Renaissance and contributed much to the new, more pluralistic philosophical climate of the fifteenth and sixteenth centuries. Medieval philosophers had had access only to a few works by Plato himself, and, while the indirect influence of the Platonic tradition was pervasive, few if any Western medieval philosophers identified themselves as Platonists. In the Renaissance, by contrast, Western thinkers had access to the complete corpus of Plato's works as well as to the works of Plotinus and many late ancient Platonists; there was also a small but influential group of thinkers who identified themselves as Christian Platonists. In the fifteenth century, the most important of these were to be found in the circles of Cardinal Bessarion (1403–72) in Rome and of Marsilio Ficino (1433–99) in Florence. Platonic themes were also central to the philosophies of Nicholas of Cusa (1401–64) and Giovanni Pico della Mirandola (1463–94), the two most powerful and original thinkers of the Quattrocento. While the dominant interpretation of the Platonic

dialogues throughout the Renaissance remained Neoplatonic, there was also a minority tradition that revived the sceptical interpretation of the dialogues that had been characteristic of the early Hellenistic Academy.

In the sixteenth century Platonism became a kind of 'countercultural' phenomenon, and Plato came to be an important authority for scientists and cosmologists who wished to challenge the Aristotelian mainstream: men like Copernicus, Giordano Bruno, Francesco Patrizi and Galileo. Nevertheless, the Platonic dialogues were rarely taught in the humanistic schools of fifteenth-century Italy. Plato was established as an important school author in the sixteenth century, first at the University of Paris and later in German universities. In Italy chairs of Platonic philosophy began to be established for the first time in the 1570s. Although the hegemony of Aristotelianism was in the end broken by the new philosophy of the seventeenth century, Plato's authority did much to loosen the grip of Aristotle on the teaching of natural philosophy in the universities of late Renaissance Europe.

JAMES HANKINS

PLEASURE

From Plato and beyond, pleasure has been thought to be a basic, and sometimes the only basic, reason for doing anything. Since there are many forms that pleasure can take and many individual views of what pleasure consists in, much attention has been given to how pleasures may be distinguished, what their motivational and moral significance might be, and whether there may not be some objective determination of them, whether some may be good or bad, or some better as pleasures than others.

But first there is the question of what pleasure is. It has been variously thought to be a state of mind like distress only of the opposite polarity; merely the absence or cessation of or freedom from pain; a kind of quiescence like contentment; or the experiencing of bodily sensations which, unlike sensations of pain, one does not want to stop. We also identify and class together particular sources of pleasure and call them pleasures of the table, company, sex, conversation, solitude, competition, contemplation or athletic pleasures. In this sense there may be some pleasures which we do not enjoy. But most generally pleasure is what we feel and take when we do enjoy something. This raises the questions of what is encompassed by 'something', what it is to enjoy anything, and the extent to which theories of pleasure can accommodate both our passivity and activity in pleasure. The most influential theories have been those of Plato, Aristotle and empiricists such as Hume and Bentham.

GRAEME MARSHALL

PLEKHANOV, GEORGII VALENTINOVICH (1857–1918)

Known as 'the Father of Russian Marxism', Plekhanov was the chief popularizer and interpreter of Marxism in Russia in the 1880s. His interest in the philosophical aspects of Marxism made him influential outside as well as inside Russia. He was a prolific writer, and dealt with several aspects of Marxist thought.

Plekhanov was an important figure in the Russian revolutionary movement. He was a founder member of the Russian Social Democratic Party, and a leading figure in its Menshevik wing after it split into Bolsheviks and Mensheviks in 1903. As a politician, Plekhanov was constantly involved in polemics with political and ideological opponents. Most of his theoretical works are to some degree polemical, and it was the conflicts among Russian revolutionary groups that shaped Plekhanov's interpretation of Marx's thought.

A basic feature of this interpretation was that Russia's historical development was like that of Western European countries, and would pass through a capitalist phase before progressing to socialism. Accordingly, Plekhanov gave prominence to those of Marx's writings which could be presented in a deterministic way. Plekhanov insisted that Marxism was a materialist doctrine (as opposed to an idealist one) and as such recognized the primacy of matter in all spheres of existence.

Plekhanov was in many ways an innovator, being the writer who first coined the term 'dialectical materialism', and who drew attention to the Hegelian origins of Marx's system. His writings were quickly translated into several European languages. His interpretation of Marxism was much admired by Lenin, and was to form the basis of the official ideology of the Soviet Union. The conception of Marxism that Plekhanov propounded continues to exercise a profound influence on conceptions of Marxism throughout the world.

JAMES D. WHITE

PLOTINUS (AD 204/5–70)

Plotinus was the founder of Neoplatonism, the dominant philosophical movement of the Graeco-Roman world in late antiquity, and the most

significant thinker of the movement. He is sometimes described as the last great pagan philosopher. His writings, the so-called *Enneads*, are preserved as whole. While an earnest follower of Plato, he reveals other philosophical influences as well, in particular those of Aristotle and Stoicism. Plotinus developed a metaphysics of intelligible causes of the sensible world and the human soul. The ultimate cause of everything is 'the One' or 'the Good'. It is absolutely simple and cannot be grasped by thought or given any positive determination. The One has as its external act the universal mind or 'Intellect'. The Intellect's thoughts are the Platonic Forms, the eternal and unchanging paradigms of which sensible things are imperfect images. This thinking of the forms is Intellect's internal activity. Its external act is a level of cosmic soul, which produces the sensible realm and gives life to the embodied organisms in it. Soul is thus the lowest intelligible cause that is immediately in contact with the sensible realm. Plotinus, however, insists that the soul retains its intelligible character such as nonspatiality and unchangeability through its dealings with the sensible. Thus he is an ardent soul–body dualist. Human beings stand on the border between the realms: through their bodily life they belong to the sensible, but the human soul has its roots in the intelligible realm. Plotinus sees philosophy as the vehicle of the soul's return to its intelligible roots. While standing firmly in the tradition of Greek rationalism and being a philosopher of unusual abilities himself, Plotinus shares some of the spirit of the religious salvation movements characteristic of his epoch.

PLURALISM

'Pluralism' is a broad term, applicable to any doctrine which maintains that there are ultimately many things, or many kinds of thing; in both these senses it is opposed to 'monism'. Its commonest use in late twentieth-century philosophy is to describe views which recognize many sets of equally correct beliefs or evaluative standards; and in this sense it is akin to 'relativism'. Societies are sometimes called 'pluralistic', meaning that they incorporate a variety of ways of life, moral standards and religions; one who sees this not as undesirable confusion but a proper state of things, espouses pluralism.

EDWARD CRAIG

PNEUMA

Pneuma, 'spirit', derives from the Greek verb *pneo*, which indicates blowing or breathing. Since breathing is necessary for life and consciousness, *pneuma* came to denote not only wind and breath but various vital functions, including sensation and thought, and was understood by some philosophers as a cosmological principle. It became especially important in Stoicism, which explained the world in terms of matter and the rational structure exhibited in all its forms; this is established by rhythmical variations in the *tonos* or 'tension' of the *pneuma*.

In Hebrew tradition, where Greek was used, *pneuma* stood for life, consciousness, and for invisible conscious agents, angels or demons. In Christian thought it denotes divine inspiration, in particular the Holy Spirit acknowledged as a divine Person. At *John* 4: 24 it is used, unusually, to describe God himself.

CHRISTOPHER STEAD

POETRY

Though poetry today seems a relatively marginal topic in philosophy, it was crucial for philosophy's own initial self-definition. In ancient Greece, poetry was revered as the authoritative expression of sacred myth and traditional wisdom. With Socrates and Plato, philosophy began by distinguishing itself from poetry as a new, superior form of knowledge which could provide better guidance for life and even superior pleasure. Just as the sophists were attacked for relativism and deception, so were poets stridently criticized for irrationality and falsehood. For Plato, not only did poetry stem from and appeal to the emotional, unreasoning aspects of human nature; it was also far removed from truth, being only an imitation of our world of appearances which itself was but an imitation of the real world of ideas or forms. He therefore insisted that poets be banished from his ideal state because they threatened its proper governance by reason and philosophy.

Subsequent philosophy of poetry has been devoted to overcoming Plato's condemnatory theory, while tending to confirm philosophy's superiority. This task, begun by Aristotle, was for a long time pursued primarily under Plato's general model of poetry (and indeed all art) as imitation or *mimesis*. The main strategy here was to argue that what poetry imitates or represents is more than mere superficial appearance, but rather general essences or the ideas themselves. For such theories, poetry's relation to truth is crucial. Other theories were later developed that preferred to define and

justify poetry in terms of formal properties or expression, or its distinctively beneficial effects on its audience. These strategies became increasingly influential from the time of Romanticism, but can be traced back to more ancient sources.

The vast majority of theories follow Plato in treating poetry as a distinct domain, separate from and subordinate to philosophy. But since Romanticism, some have argued for the essential unity of these two enterprises. Great philosophy is here seen as the poetic creation of new ways of thinking and new forms of language, and the role of poetry as uniting and gathering things together so that the truth and presence of being shines forth.

RICHARD M. SHUSTERMAN

POINCARÉ, JULES HENRI (1854–1912)

Although primarily a mathematician, Henri Poincaré wrote and lectured extensively on astronomy, theoretical physics, philosophy of science and philosophy of mathematics at the turn of the century. In philosophy, Poincaré is famous for the conventionalist thesis that we may choose either Euclidean or non-Euclidean geometry in physics, claiming that space is neither Euclidean nor non-Euclidean and that geometry is neither true nor false. However, Poincaré's conventionalism was not global, as some have claimed. Poincaré held that only geometry and perhaps a few principles of mechanics are conventional, and argued that science does discover truth, despite a conventional element.

Poincaré followed new developments in mathematics and physics closely and was involved in discussion of the foundations of mathematics and in the development of the theory of relativity. He was an important transitional figure in both of these areas, sometimes seeming ahead of his time and sometimes seeming very traditional. Perhaps because of the breadth of his views or because of the way in which philosophers focused on issues or small pieces of his work rather than on accurate history, interpretations of Poincaré vary greatly. Frequently cited by the logical positivists as a precursor, and widely discussed in the philosophy of science and the philosophy of mathematics, Poincaré's writings have had a strong impact on English-language philosophy.

POLANYI, MICHAEL (1891–1976)

Michael Polanyi was almost unique among philosophers in not only fully acknowledging but in arguing from the tacit dimensions of our knowledge which concern the many things which we know but cannot state nor even identify. He argued that our knowledge is a tacit, personal integration of subsidiary clues into a focal whole, and he elaborated this structure of knowing into a corresponding ontology and cosmology of a world of comprehensive entities and actions which are integrations of lower levels into higher ones. Polanyi used these accounts of knowing and being to argue against the 'critical' demands for impersonal, wholly objective and fully explicit knowledge, against reductionist attempts to explain higher levels in terms of lower ones, and to defend the freedom of scientific research and a free society generally.

R.T. ALLEN

POLITICAL PHILOSOPHY

Introduction

Political philosophy can be defined as philosophical reflection on how best to arrange our collective life – our political institutions and our social practices, such as our economic system and our pattern of family life. (Sometimes a distinction is made between *political* and *social* philosophy, but I shall use 'political philosophy' in a broad sense to include both.) Political philosophers seek to establish basic principles that will, for instance, justify a particular form of state, show that individuals have certain inalienable rights, or tell us how a society's material resources should be shared among its members. This usually involves analysing and interpreting ideas like freedom, justice, authority and democracy and then applying them in a critical way to the social and political institutions that currently exist. Some political philosophers have tried primarily to justify the prevailing arrangements of their society; others have painted pictures of an ideal state or an ideal social world that is very different from anything we have so far experienced (see Utopianism).

Political philosophy has been practised for as long as human beings have regarded their collective arrangements not as immutable and part of the natural order but as potentially open to change, and therefore as standing in need of philosophical justification. It can be found in many different cultures, and has taken a wide variety of forms. There are two reasons for this diversity. First, the methods and approaches used by political

philosophers reflect the general philosophical tendencies of their epoch. Developments in epistemology and ethics, for instance, alter the assumptions on which political philosophy can proceed. But second, the political philosopher's agenda is largely set by the pressing political issues of the day. In medieval Europe, for instance, the proper relationship between Church and State became a central issue in political philosophy; in the early modern period the main argument was between defenders of absolutism and those who sought to justify a limited, constitutional state. In the nineteenth century, the social question – the question of how an industrial society should organize its economy and its welfare system – came to the fore. When we study the history of political philosophy, therefore, we find that alongside some perennial questions – how can one person ever justifiably claim the authority to govern another person, for instance – there are some big changes: in the issues addressed, in the language used to address them, and in the underlying premises on which the political philosopher rests his or her argument. (For the development of the Western tradition of political philosophy, see POLITICAL PHILOSOPHY, HISTORY OF.)

One question that immediately arises is whether the principles that political philosophers establish are to be regarded as having universal validity, or whether they should be seen as expressing the assumptions and the values of a particular political community. This question about the scope and status of political philosophy has been fiercely debated in recent years. It is closely connected to a question about human nature (see HUMAN NATURE). In order to justify a set of collective arrangements, a political philosophy must say something about the nature of human beings, about their needs, their capacities, about whether they are mainly selfish or mainly altruistic, and so forth. But can we discover common traits in human beings everywhere, or are people's characters predominantly shaped by the particular culture they belong to?

If we examine the main works of political philosophy in past centuries, they can be divided roughly into two categories. On the one hand there are those produced by philosophers elaborating general philosophical systems, whose political philosophy flows out of and forms an integral part of those systems. Leading philosophers who have made substantial contributions to political thought include PLATO, ARISTOTLE, AUGUSTINE, AQUINAS, HOBBES, LOCKE, HUME, HEGEL and J.S. MILL. On the other hand there are social and political thinkers whose contribution to philosophy as a whole has had little lasting significance, but who have made influential contributions to political philosophy specifically. In this category we may include CICERO, Marsilius of Padua, MACHIAVELLI, GROTIUS, ROUSSEAU, BENTHAM, FICHTE and MARX. Two important figures whose work reflects non-Western influences are Ibn Khaldhun and Kauṭilya. Among the most important twentieth-century political thinkers are ARENDT, BERLIN, DEWEY, FOUCAULT, Gandhi, Gramsci, HABERMAS, Hayek, Oakeshott, RAWLS, SARTRE and TAYLOR.

1 Political institutions and ideologies

What are the issues that, historically and today, have most exercised political philosophers? To begin with, there is a set of questions about how political institutions should be arranged. Today we would think of this as an inquiry into the best form of state, though we should note that the state itself is a particular kind of political arrangement of relatively recent origin – for most of their history human beings have not been governed by states (see STATE, THE). Since all states claim AUTHORITY over their subjects, two fundamental issues are the very meaning of authority, and the criteria by which we can judge forms of political rule legitimate (see LEGITIMACY; CONTRACTARIANISM; TRADITION AND TRADITIONALISM). Connected to this is the issue of whether individual subjects have a moral obligation to obey the laws of their state (see OBLIGATION, POLITICAL), and of the circumstances under which politically-inspired disobedience is justifiable (see CIVIL DISOBEDIENCE; REVOLUTION). Next there is a series of questions about the form that the state should take: whether authority should be absolute or constitutionally limited (see ABSOLUTISM; CONSTITUTIONALISM); whether its structure should be unitary or federal (see FEDERALISM AND CONFEDERALISM); whether it should be democratically controlled, and if so by what means (see DEMOCRACY; REPRESENTATION, POLITICAL). Finally there is the question of whether any general limits can be set to the authority of the state – whether there are areas of individual freedom or privacy that the state must never invade on any pretext (see FREEDOM OF SPEECH; COERCION; PROPERTY; SLAVERY), and whether there are subjects such as religious doctrine on which the state must adopt a strictly neutral posture (see NEUTRALITY, POLITICAL; TOLERATION).

Beyond the question of how the state itself should be constituted lies the question of the general principles that should guide its decisions.

What values should inform economic and social policy for instance? Part of the political philosopher's task is to examine ideas that are often appealed to in political argument but whose meaning remains obscure, so that they can be used by politicians from rival camps to justify radically contrasting policies. Political philosophers try to give a clear and coherent account of notions such as EQUALITY, FREEDOM AND LIBERTY, JUSTICE, Needs and interests, Public interest, RIGHTS and WELFARE. And they also try to determine whether these ideas are consistent with, or conflict with, one another – whether, for instance, equality and liberty are competing values, or whether a society might be both free and equal at once.

Further questions arise about the principles that should guide one state in its dealings with other states. May states legitimately pursue what they regard as their national interests, or are they bound to recognize ethical obligations towards one another? More widely, should we be seeking a cosmopolitan alternative under which principles of justice would be applied at global level? (See INTERNATIONAL RELATIONS, PHILOSOPHY OF; GLOBALIZATION.) When, if ever, are states justified in going to war with each other? (See WAR AND PEACE, PHILOSOPHY OF.)

Over about the last two centuries, political debate has most often been conducted within the general frameworks supplied by rival ideologies. We can think of an ideology as a set of beliefs about the social and political world which simultaneously makes sense of what is going on, and guides our practical responses to it (see IDEOLOGY). Ideologies are often rather loosely structured, so that two people who are both conservatives, say, may reach quite different conclusions about some concrete issue of policy. Nevertheless they seem to be indispensable as simplifying devices for thinking about a political world of ever-increasing complexity.

No political philosopher can break free entirely from the grip of ideology, but political philosophy must involve a more critical scrutiny of the intellectual links that hold ideologies together, and a bringing to light of the unstated assumptions that underpin them. The most influential of these ideologies have been LIBERALISM, CONSERVATISM, SOCIALISM, nationalism (see NATION AND NATIONALISM) and Marxism (see MARXISM, WESTERN; MARXIST PHILOSOPHY, RUSSIAN AND SOVIET). Other ideologies are of lesser political significance, either because they have drawn fewer adherents or because they have been influential over a shorter period of time (see ANARCHISM, COMMUNISM, FASCISM, LIBERTARIANISM, REPUBLICANISM, SOCIAL DEMOCRACY and TOTALITARIANISM).

2 Contemporary political philosophy

The last quarter of the twentieth century has seen a powerful revival of political philosophy, which in Western societies at least has mostly been conducted within a broadly liberal framework. Other ideologies have been outflanked: Marxism has gone into a rapid decline, and conservatism and socialism have survived only by taking on board large portions of liberalism. Some have claimed that the main rival to liberalism is now communitarianism (see COMMUNITY AND COMMUNITARIANISM); however on closer inspection the so-called liberal – communitarian debate can be seen to be less a debate about liberalism itself than about the precise status and form that a liberal political philosophy should take – whether, for example, it should claim universal validity, or should present itself simply as an interpretation of the political culture of the Western liberal democracies. The vitality of political philosophy is not to be explained by the emergence of a new ideological revival to liberalism, but by the fact that a new set of political issues has arisen whose resolution will stretch the intellectual resources of liberalism to the limit.

What are these issues? The first is the issue of social justice, which in one form or another has dominated political philosophy for much of the century. Most of the many liberal theories of justice on offer have had a broadly egalitarian flavour, demanding at least the partial offsetting of the economic and social inequalities thrown up by an unfettered market economy (see MARKET, ETHICS OF THE; JUSTICE; RAWLS, J.; DWORKIN, R.; though for dissenting views see NOZICK, R.). These theories rested on the assumption that social and economic policy could be pursued largely within the borders of a self-contained political community, sheltered from the world market. This assumption has become increasingly questionable, and it presents liberals with the following dilemma: if the pursuit of social justice is integral to liberalism, how can this be now be reconciled with individual freedoms to move, communicate, work and trade across state boundaries?

The second issue is posed by feminism, and especially the feminist challenge to the conventional liberal distinction between public and private spheres (see FEMINIST POLITICAL PHILOSOPHY). In many respects feminism and liberalism are natural allies, but when feminists argue for fundamental changes in the way men and women conduct their personal relationships, or advocate affirmative action policies for employment that seem to contravene firmly-entrenched liberal principles of desert and merit, they pose major challenges to liberal political philosophy.

Third, there is a set of issues arising from what we might call the new politics of cultural identity.

Many groups in contemporary societies now demand that political institutions should be altered to reflect and express their distinctive cultures; these include, on the one hand, nationalist groups asserting that political boundaries should be redrawn to give them a greater measure of self-determination, and on the other cultural minorities whose complaint is that public institutions fail to show equal respect for those attributes that distinguish them from the majority (for instance their language or religion) (see NATION AND NATIONALISM; MULTICULTURALISM; POSTCOLONIALISM). These demands once again collide with long-established liberal beliefs that the state should be culturally neutral, that citizens should receive equal treatment under the law, and that rights belong to individuals, not groups (see CITIZENSHIP; AFFIRMATIVE ACTION; DISCRIMINATION). It remains to be seen whether liberalism is sufficiently flexible to incorporate such demands.

Finally, liberalism is challenged by the environmental movement, whose adherents claim that liberal political principles cannot successfully address urgent environmental concerns, and more fundamentally that the liberal image of the self-sufficient, self-directing individual is at odds with the ecological picture of humanity's subordinate place in the system of nature as a whole (see GREEN POLITICAL PHILOSOPHY; ENVIRONMENTAL ETHICS; SUSTAINABILITY). Liberalism, it is said, is too firmly wedded to the market economy and to consumption as the means of achieving personal wellbeing to be able to embrace the radical policies needed to avoid environmental disaster.

None of these problems is capable of easy solution, and we can say with some confidence that political philosophy will continue to flourish even in a world in which the sharp ideological divisions of the mid-twentieth century no longer exist. We may also expect a renewal of non-Western traditions of political philosophy as free intellectual inquiry revives in those countries where for half a century or more it has been suppressed by the state. Political questions that have concerned philosophers for two millennia or more will be tackled using new languages and new techniques, while the ever-accelerating pace of technological and social change will generate new problems whose solutions we can barely begin to anticipate.

POLITICAL PHILOSOPHY, HISTORY OF

The history of political philosophy attempts to yield a connected account of past speculation on the character of human association at its most inclusive level. 'History' or 'philosophy' may be stressed depending on whether the organizing principle is the temporal sequence or conceptual framework of political thought. Anglophone work has increasingly been organized around distinctive political 'languages' defined by specific vocabularies, syntaxes and problems, for example, classical republicanism, Roman law, natural law, utilitarianism. Chronologically it has been usual to observe divisions between ancient, medieval, Renaissance, early modern and modern periods of study.

Ancient Greece is the source of the earliest political reflection, with a continuous history in the West. Here reflection on the nature and proper organization of political community stimulated inquiry into the difference between nature and convention, the public and the domestic realm, the distinctive character of political rule, the relationship between political life and philosophy, the identity of justice, and the taxonomy of state-forms – as well as a more sociological investigation of the stability and decline of political regimes.

Greek political vocabulary was adapted to existing Roman republican practice (by Polybius and Cicero for example), which soon gave way to an imperial constitution stressing peace, order and unity. Rome thus generated two contrasting political ideals – that of the virtuous active republican citizen, and that of the unified empire governed by Roman law. Together with questions about the causes of its own rise and decline, Rome thus provided political values and historical

material for subsequent philosophical and historical reflection.

Christianity undermined the pagan autonomy of politics in the name of a higher, transcendent ideal. However, it adapted much of Greek rationalism and the political vocabulary of classical culture in elaborating a creed and an institutional form. In turn it lent legitimacy to imperial and royal officeholders of Rome and barbarian successor-kingdoms.

Medieval political philosophy was characteristically preoccupied with the relationship between pope and king, church and *regnum*, but philosophy as a discipline was subordinated to theology. This was challenged by the rediscovery of Aristotle's self-sufficiently secular political ideal, a challenge met for a while by Aquinas' synthesis. However, the autonomy of secular politics was continually reasserted by a sequence of writers – Bartolus of Sassoferrato, Marsilius of Padua, Bruni and Machiavelli – who revived and reformulated classical republicanism using both Roman law and new Renaissance techniques and insights.

The Reformation, although initially politically quiescent, gave rise to new conflicts between secular and sacred rule. In particular, radical claims about the responsibility of all believers for their own salvation fed through in various ways into more individualistic political philosophies. In early modern Europe, using the strikingly new (and originally Catholic) vocabulary of natural right, Hugo Grotius aspired to provide a common secular basis for a shared political morality, on the basis of individual rights derived from a universal right of self-preservation. This was widely explored by seventeenth- and eighteenth-century thinkers, notably Hobbes and Locke, and culminated politically in the American and French Revolutions. In the aftermath of the French Revolution, language of natural rights was rejected both by conservative thinkers, such as Burke, and by a new, utilitarian radicalism largely forged by Bentham.

Attempts to grasp the political character of economic transformations and Empire in early modern Europe resulted in a growing engagement with the essentially historical character of politics, the dynamic of which republican discourse was particularly well suited to exploring. Avoiding the loss of liberty which the acquisition of Empire had seemed to entail in Rome involved rethinking possible patterns of politico-economic development, providing a new definition of liberty which stressed personal and economic over political freedom, and proposing that impersonal institutional devices could replace virtuous motives in guaranteeing political liberty and stability. Such possibilities were explored by Montesquieu and Constant in France, Hume and Smith in Britain and 'Publius' (Madison, Hamilton and Jay) in America. They were rejected outright by Rousseau, for whom only the active citizen could guarantee rights, civic or civil.

The French Revolution was not only an event in which political philosophy played an important if hotly contested role; it also, like the rise and fall of Rome, provided a central topic for subsequent political reflection. The character of modernity, the nature of revolution, the relationship of political ideas to political action, the strength or weakness of rationalism as an informing principle, the viability and desirability of the Revolutionary ideals of liberty, equality and fraternity, all became topics of philosophical speculation by post-Revolutionary thinkers such as Constant, Cabet, de Tocqueville, Burke, de Maistre, Saint-Simon, Owen and Coleridge, as well as a later generation including Comte, Carlyle and Marx.

In contrast to his predecessors' use of Lockean psychology and the conditioning effects of experience and association to understand the processes of socio-economic change, Kant's postulation of the transcendent self initiated a new vocabulary of idealism. This culminated in Hegel's attempt to show how philosophical and historical (including political) change could be understood as the development and realization of a trans-historical consciousness or *Geist*, seeking to overcome internal tensions through a process of projection and transcendence.

The notion that human self-understanding and practices are to be understood historically greatly influenced subsequent political thinking, being central to the ideas of Marx, Nietzsche and Freud (as well as shaping many of J.S. Mill's modifications of classical utilitarianism). All three of the former owed insights to Hegel's claims about the crucial and emblematic character of the master–slave struggle. However, while for Hegel and Marx the slave's insights represent the transition to a higher form of consciousness – mediated in Marx's case by a class revolution – for Nietzsche (despairingly) and Freud (resignedly) repression was a constitutive and self-perpetuating feature of modern politics.

While nineteenth-century political thought was preoccupied with the historical conditioning of political sensibilities, Freud's discovery of the unconscious was accompanied by the emergence of a mass, irrationalist politics, characteristic of the twentieth century, and more suited to sociological than philosophical analysis. Nevertheless rationalist political theory, deriving from utilitarianism, and frequently drawing on (and contributing to) economic thought, remains the dominant accent in contemporary political philosophy.

IAIN HAMPSHER-MONK

POMPONAZZI, PIETRO (1462–1525)

Pietro Pomponazzi was the leading Aristotelian philosopher in the first quarter of the sixteenth century. His treatise *De immortalitate animae* (*On the Immortality of the Soul*) (1516) argues that although faith teaches immortality, natural reason and Aristotelian principles cannot prove it. In *De incantationibus* (On Incantations) (first published in 1556), Pomponazzi attempts to demonstrate on rational grounds that all reported miraculous suspensions or reversals of natural laws can be explained by forces within nature itself. Separating faith and reason once again, Pomponazzi proclaims his belief in all canonical miracles of the Church. These arguments cast doubt on morality, for without an afterlife, humanity is deprived of rewards for virtue and punishment for evil; and nature itself appears to be governed by impersonal forces unconcerned with human affairs. However, morality is restored to the universe by the human powers of rational reflection which lead to the pursuit of virtue. Yet in *De fato* (On Fate) (first published in 1567), Pomponazzi challenges the very basis of his own ethical doctrine by arguing that all activity of insentient and sentient beings is directed to preordained ends by environmental factors. Unable to justify human freedom on rational grounds, he then seeks to re-establish it using arguments derived from Christian natural theology, thus reversing his usual separation of faith and reason.

MARTIN L. PINE

POPPER, KARL RAIMUND (1902–94)

Introduction

Popper belongs to a generation of Central European émigré scholars that profoundly influenced thought in the English-speaking countries during the twentieth century. His greatest contributions are in philosophy of science and in political and social philosophy. Popper's 'falsificationism' reverses the usual view that accumulated experience leads to scientific hypotheses; rather, freely conjectured hypotheses precede, and are tested against, experience. The hypotheses that survive the testing process constitute current scientific knowledge. His general epistemology, 'critical rationalism', commends the Socratic method of posing questions and critically discussing the answers offered to them. He considers knowledge in the traditional sense of certainty, or in the modern sense of justified true belief, to be unobtainable.

After the *Anschluss*, Popper was stimulated by the problem of why democracies had succumbed to totalitarianism and applied his critical rationalism to political philosophy. Since we have no infallible ways of getting or maintaining good government, Plato's question 'Who should rule?' is misdirected. To advocate the rule of the best, the wise or the just invites tyranny disguised under those principles. By contrast, a prudently constructed open society constructs institutions to ensure that any regime can be ousted without violence, no matter what higher ends it proclaims itself to be seeking. Couched in the form of extended critiques of Plato and Platonism as well as of Marx and Marxism, Popper's political philosophy has had considerable influence in post-war Europe, East and West.

1 Life and works

Born in Vienna in 1902, the youngest child of a barrister, Karl Raimund Popper was educated at the University of Vienna, where he studied mathematics, music, psychology, physics and philosophy. He taught in secondary school between 1930 and 1936. Apprehension about Nazism persuaded him to emigrate in 1937, to become lecturer in philosophy at Canterbury University College, Christchurch, New Zealand. In January 1946 he became Reader in Logic and Scientific Method at the London School of Economics, was promoted to professor in 1949, and retired from full-time teaching in 1969. Among many honours, he was knighted in 1965, elected Fellow of the Royal Society in 1976, and made a Companion of Honour in 1982.

After a specialized start in the philosophy of science, Popper revealed himself as a philosopher of wide reach, making contributions across the spectrum from Presocratic studies to modern logic, from politics to probability, and from the mind–body problem to the interpretation of quantum theory. With all of his books in print, and translated into many languages, Popper's is one of the most discussed philosophies of the century. Yet, he insisted, his ideas are systematically misunderstood and misrepresented; this led him to devote uncommon energy to issues of interpretation and commentary on his own work.

Popper published three major works between 1935 and 1945. The first, *Logik der Forschung* (1935), his theory of science, appeared in English as *The Logic of Scientific Discovery* only in 1959. The second, *The Poverty of Historicism* (1957), first appeared in 1944–5 and extended his theory of science to history and society, severely criticizing the notion of historical laws. The third, *The Open Society and Its Enemies* (1945), is a two-volume treatise on the philosophy of history, politics and society.

Popper's other principal works consist of two collections of major papers, *Conjectures and Refutations* (1962), and *Objective Knowledge* (1972); a Library of Living Philosophers volume (1974) containing an intellectual autobiography and a set of replies to his critics, the former appearing separately as *Unended Quest* (1976); a collaboration with Sir John Eccles on a study of the mind–body problem, *The Self and Its Brain* (1977); *Die Beiden Grundprobleme der Erkenntnistheorie* (The Two Basic Problems of the Theory of Knowledge) (1979), the extant fragment of the book he was writing before *Logik der Forschung* superseded it; and the long-delayed *Postscript to the Logic of Scientific Discovery* (1982–3), much of which dates from the period 1955–7. Most of these books have seen multiple editions, involving sometimes minor and sometimes major changes. Throughout his career Popper also produced many original papers on diverse topics, and lectured all over the world. His manuscripts and correspondence fill some 450 archive cartons at the Hoover Institution, Stanford University.

2 Theory of science

Two problems structure Popper's theory of science: he calls them 'the problem of induction' and 'the problem of demarcation'. The problem of induction can be formulated as: what relation holds between theoretical knowledge and experience? The problem of demarcation can be formulated as: what distinguishes science from metaphysics as well as from logic and mathematics?

The received answers to these problems are: we get knowledge from experience by means of induction, that is, by inferring universal theories from accumulations of particular facts; and the inductive method demarcates science from metaphysics as well as from logic and mathematics. However, HUME showed that inductive inferences are invalid, hence the *problem* of induction: either we get knowledge from experience by invalid means (irrationalism) or we do not get any at all (scepticism); and induction collapses as a demarcation criterion (see DEMARCATION PROBLEM; INDUCTION, EPISTEMIC ISSUES IN).

In Part I of *The Logic of Scientific Discovery*, Popper's solutions to these two problems are set out and shown to converge: knowledge results when we accept statements describing experience that contradict and hence refute our hypotheses; thus a deductive rather than an inductive relation holds between theoretical knowledge and experience. Experience teaches us by correcting our errors. Only hypotheses *falsifiable* by experience should count as scientific. There is no need for the inductive leap that Hume thought illogical but unavoidable; and the Hobson's choice between irrationalism or scepticism is avoided. To the question, 'Where do hypotheses come from, if not inductively from experience?', Popper answers, like Francis Bacon, that they come from our propensity to guess (see BACON, F. §6); in any case they cannot come from observation alone because there is no observation without hypotheses. Hypotheses are both logically and psychologically prior to observation. We are theorizing all the time in order to navigate in the world, and our encounters with negative evidence are the bumps that deliver information about the shape of reality.

The Logic of Scientific Discovery is dialectical in style, dealing with the traditional alternatives and the objections to each idea as it goes along. It is remarkable how frequently critics rediscover objections set out and answered in the book. The commonest objection is that, just as no amount of experience will conclusively verify a statement, so no amount of experience will conclusively falsify it. To answer this objection Popper points to a logical asymmetry. A universal statement cannot be derived from or verified by singular statements, no matter how many are marshalled. It can, however, be contradicted by one singular statement. The logic of falsification is the issue; conclusiveness is a red herring. Another argument, to the effect that the force of falsifying evidence can always be evaded by *ad hoc* definition or simple refusal to countenance it, Popper finds insuperable. The way to proceed, he concludes, is to entrench falsifiability in a methodology.

For Popper, a methodology is a policy decision governing action and embodied in norms or 'methodological rules'. Our decisions concern which course of action will best foster our aims. Thus falsificationism is made into a supreme rule to the effect that the 'rules of scientific procedure must be designed in such a way that they do not protect any statement in science against falsification' (*The Logic of Research* 1935). The rule for causality is typical of the small number offered: 'we are not to abandon the search for universal laws and for a coherent theoretical system, nor ever to give up our attempts to explain causally any kind of event we can describe' (*The Logic of Research*). A broad epistemological ambition is revealed when Popper generalizes: 'It might indeed be said that the

majority of problems of theoretical philosophy, and the most interesting ones, can be reinterpreted . . . as problems of method' (*The Logic of Research*) (see Scientific method §2).

Throughout *The Logic of Scientific Discovery*, Popper defines his position by debate and contrast with logical positivist positions regarding meaning, and with two traditional views regarding science, inductivism and the conventionalism of Poincaré and Duhem (see Conventionalism; Logical positivism §4). It is notable that, like the logical positivists, Popper expresses unbounded respect for science. Unlike them, he grants a constructive (historical) role to metaphysics in science, seen as directly descended from the earliest Greek speculations about the nature of the world. The demarcation between science and metaphysics is thus a matter for decision, not a discovery about the nature of things. Popper's attacks on central logical positivist contentions contributed to the demise of that movement.

Popper respects conventionalism as self-contained, defensible and most likely consistent. His objection is that it risks treating obsolete or floundering science as incontrovertible truth. Yet Popper is a conventionalist in one respect: methodology. As opposed to the 'methodological naturalism' of the logical positivists, who treat the demarcation between science and metaphysics as a difference existing in the nature of things, or rather, in the nature of language, Popper is a 'methodological conventionalist', proposing rules that embody choices or decisions – which are in turn governed by aims. His demarcation should be judged, Popper maintains, by whether it proves fruitful in furthering the aims of discovering new ideas and new problems.

Part II of *The Logic of Scientific Discovery* consists of chapters on theories, falsifiability, the empirical basis, testability, simplicity, probability, quantum theory and corroboration. Each is an expansion, development and defence of the ideas briefly stated in Part I and parries a particular cluster of critical objections. The chapters on probability and corroboration, for example, deal at length with the objections that the pervasive probability statements of modern science are not falsifiable, and that they measure the strength of our inductive evidence. The chapters endeavour to show how probability statements can be falsified in relevant ways, and how they are better interpreted as statements of frequencies rather than as measures of inductive support.

3 Later ideas

The English translation of *The Logic of Scientific Discovery* is palimpsestic: while translating it Popper intercalated comments, glosses, developments and corrections in new footnotes and appendices, as well as drafting a supplementary work, the three-volume *Postscript* of 1982–3. Opinion differs over whether all this is fully consistent. A case in point is 'The Aim of Science' section of the *Postscript*, published already in 1957, which argues that science aims at satisfactory explanations. It centres around a historical example (Galileo, Kepler, Newton), showing how each theory superseded and explained its predecessor. Satisfactory explanation, in addition to being testable, must fulfil other conditions, making it a rather stronger aim than falsifiability, one that may or may not be the same as the aim of science articulated at the end of *The Logic of Scientific Discovery*, of discovering 'new, deeper and more general problems'.

Certainly Popper acknowledges some changes of view. Since metaphysical dispute surrounded the concept of truth, he carefully avoided using it in *The Logic of Scientific Discovery*, making do with logical relations (implication, tautology, contradiction). Later, convinced by Tarski's work, he made free use of the concept of truth and of getting nearer to the truth (verisimilitude). Again, his criticisms of conventionalism in *The Logic of Scientific Discovery* were methodological. In later years they were also openly metaphysical, as Popper espoused a robust realism and indeterminism.

Throughout *The Logic of Scientific Discovery* there are Darwinian metaphors – the struggle for survival among theoretical systems, natural selection, fitness to survive – although, in the last pages of the book, the view that science is an instrument of biological adaptation is rejected. This Darwinian leitmotif became a controversial issue in Popper's later work: did evolutionary biology yield to the same methodological analysis as physics? Were the central ideas of Darwin or of the modern synthesis falsifiable? To complicate matters, Popper changed his mind on this central question, viewing Darwinism as a historical hypothesis in *Objective Knowledge*, and as an unfalsifiable near tautology in *Unended Quest*. In contrast to his earlier view, Popper also began to advocate an evolutionary epistemology, that is, an attempt to explain the very existence of a truth-seeking science within the framework of natural selection, in effect to give a biological twist to Kant's problem, 'How is knowledge possible?' His second Herbert Spencer Lecture (1975) treats both endosomatic and exosomatic adaptations as forms of knowledge. Biological considerations also weigh heavily in Popper's part of *The Self and Its Brain*. Pitting himself against the reductionist materialism of most contemporary mind–body specialists, Popper there marshalled mainly indirect arguments for an interactive pluralism.

Reflections on biology seem to have been behind a bold new metaphysical initiative of 1967–8, especially the provocatively entitled 'Epistemology Without a Knowing Subject' (*Objective Knowledge* 1972: ch. 3). Distinguishing the world of physical things from the world of mental things, Popper argued that objective knowledge is located in neither, but in 'World 3' – the world of humanly created objective contents of thought. Such intellectual products have an objective existence: theories, problems, problem-situations, theoretical situations and critical arguments have properties and logical interrelations that lack physical or mental analogues. Stored knowledge exists even if no living person retrieves it. Critics of World 3 find some of its consequences counterintuitive: for example, it contains not only all truths, but also all falsehoods, which thus have an equally objective 'existence'.

In the late 1940s Popper published a particularly forceful and elegant system of natural deduction that is of considerable interest, both intrinsically and because in it he views deductive logic as the *organon* of criticism. He reports that while he has repaired some defects in it, he never brought it to completion. His technical attentions became focused on the theory of probability, to which he had already contributed in *The Logic of Scientific Discovery.* The result was a highly abstract axiomatic system that made no explicit assumptions about any logical relations among the elements on which probability is defined, and thereby established that probability is a genuine generalization of deducibility. The system is open to many new interpretations of probability statements. A particularly important one, superseding the frequency interpretation of *The Logic of Scientific Discovery*, views probabilities as measures of the 'propensities' of states of the world to develop one way rather than another. In the *Postscript* (1982) and *A World of Propensities*, this view was developed into a striking new metaphysics (see PROBABILITY, INTERPRETATIONS OF §4).

4 Democracy, society and individualism

In *Unended Quest*, Popper recounts how, as a politically conscious adolescent, he flirted with communism. He was quickly disillusioned when he judged communist actions irresponsible in leading to the deaths of some demonstrators. (Individual autonomy, responsibility, Socratic fallibilism and the obligation to reduce suffering are the keynotes of his scattered remarks about ethics.) In the 1920s he began a critique of Marx and Marxism, first tried out in a talk of 1935, 'The Poverty of Historicism'. 'Historicism' is Popper's name for the idea that there are inexorable laws of historical development: the demand that if natural science can predict eclipses then social science ought to be able to predict political revolutions. In a highly systematic way, Popper set out to show how both those who think the social sciences are not at all like the natural sciences (the 'anti-naturalists'), and those who think the social sciences very like the natural sciences (the 'naturalists'), share the aim of predicting history. Both recommend the methodology of historicism, which he sees as impoverished and inclined to treat societies as wholes responding to the pressures of inchoate social forces (see HISTORICISM).

Instead, Popper recommends 'methodological individualism': rules to the effect that the behaviour and actions of collectives should be explained by the behaviour of human individuals acting appropriately to the logic of their social situation as best they can and as best they see it. Not only was the alternative unfruitful, he argued, but the best social explanations of Plato and Marx were individualist. What look like holistic phenomena are to be explained as the 'unintended consequences' of such individual actions reverberating through the social set-up (see HOLISM AND INDIVIDUALISM IN HISTORY AND SOCIAL SCIENCE).

According to methodological individualism, social theories are tested not by historical predictions, which are little more than prophecies, Popper argues, but by attempts to invent institutions that correct social faults by social engineering. Man-made social institutions are hypotheses in action, he says. If we are to refute these hypotheses we need to avoid complicating matters with large-scale experiments, or too many at once, otherwise assessment will be impossible. For we must also reckon with the interference factor of 'the Oedipus effect', that is, the way in which a prediction about the future becomes an altering factor in the situation as human beings are aware of it, thus 'interfering' with the outcome.

The Open Society and Its Enemies was a 'truly unintended consequence' of an attempt to expand aspects of *The Poverty of Historicism* to satisfy puzzled friends. When it grew too large, Popper made it a separate work. On publication in 1945 it elevated him from academic obscurity to academic fame. He became a controversial and well-known public intellectual.

Described modestly as a 'critical introduction to the philosophy of politics and of history', *The Open Society* had become, in the seven years of its gestation, a major treatise on the intellectual and social ills of the time, offering an explanation of how totalitarianism had gained intellectual respectability and how purging post-war society of it

would involve rethinking politics, education and social morality. Its title refers to two ideal-types used throughout. A closed society is one which takes a magical or tabooistic attitude to tradition and custom, which does not differentiate between nature and convention. An open society marks that difference and confronts its members with personal decisions and the opportunity to reflect rationally on them. Heraclitus, Aristotle and Hegel are briefly discussed, but the book's two intellectual anti-heroes are PLATO in volume 1 and MARX in volume 2.

The volume entitled 'The Spell of Plato' answers two questions: first, why Plato espoused totalitarian ideas and second, why students of Plato have whitewashed that fact and beautified him. The answer to the first question, a deeply sympathetic piece of writing, sketches a portrait of the young Plato contemplating with dismay the closed world of tribal Athens giving way to a more liberal and open society, with loss of social privilege and chaos arriving hand in hand. Popper insists on the brilliance of Plato's sociological analysis of the causes of change and of his proposals to arrest it and staunch the deterioration it brings. In answer to the second, Popper courts controversy by suggesting that Plato's intellectual followers, flattered by the role offered them, engaged in a long-running *trahison des clercs* by presenting as liberal and enlightened the doctrine of the philosopher-king.

To expose the commitment of Plato and Platonists to totalitarianism, Popper had to clarify our ideals of a liberal and democratic social order and show how Plato indulges in persuasive definitions, while attempting to show that his totalitarian *Republic* is 'just'. (Popper also mounts a general attack on the idea that philosophy should seek out the essence of universal words such as justice, democracy and tyranny. He argues that natural science uses the methodology of nominalism, not of essentialism, and social science and philosophy would do well to follow suit.) Mindful of Plato's distaste for majority rule, as rule of the mob or rule of the worst, Popper carefully discusses tyranny, and concludes that the problem is not the question of what is popular, for certain kinds of tyrants are very popular and could easily be elected. So an open and liberal society is not to be identified with a popularly elected government. No more is it a matter of what is just, good or best, for none of these offers insurance against tyranny in their name. In line with his theory of science, and of knowledge generally, he proposes a *via negativa*. The issue is not what regime we want, but what to do about ones we do not want. The problem with tyranny is that the citizens have no peaceful way in which to rid themselves of it, should they want to. Popper proposes a now famous and generally endorsed criterion for democracy as that political system which permits the citizens to rid themselves of an unwanted government without the need to resort to violence. He exposes Plato's question, 'Who should rule?' and all similar discussions of sovereignty as subject to paradoxes because the question permits an inconsistency to develop between the statement designating the ruler (for example, the best or wisest should rule) and what the ruler commands (for example, the best or wisest may then tell us: obey the majority, or the powerful). Popper noticed that the question carries the authoritarian implication that whoever is so named is *entitled* to rule. He replaces them with the practical question 'How can we rid ourselves of bad governments without violence?', with its implication that rulers are on permanent parole. Popper's is a fundamentally pessimistic view that all governments are to one extent or the other incompetent and potentially criminal in their misbehaviour, and that only a political system which allows them to govern at the sufferance of citizens who can withdraw their support readily is one with more or less effective checks against abuse. Even so, the fallibility of our institutional hypotheses enjoin upon us an eternal vigilance.

The second volume, 'The High Tide of Prophecy, Hegel and Marx', argues that the prophetic tendency in Heraclitus and Plato produced in Hegel a damaging incoherence and charlatanry, and in Marx a project for the scientific study of society that, despite noble emancipating aims, foundered, especially among the followers, on the confusion of prediction with unscientific historical prophecy and hence on a fundamental misconstruction of scientific method. The chapters on Marx are among the most penetrating commentaries ever written on him, and are both sympathetic in their appreciation and unremitting in their criticism. Although Popper clearly regards Plato as the deeper thinker, he argues that Marx has much to teach us about how moral and emancipatory impulses can go awry. Marxists and the radical experimenters of the Soviet Union are judged harshly, as are all forms of nationalism.

Appearing in 1945 just after the end of the war, a war that had forged an alliance with the Soviet Union, the book antagonized many powerful intellectual interest groups. Platonists were taken aback to be accused of being apologists for totalitarian tendencies in Plato (even though Popper was not the first to point these out) and Marxists were equally affronted. The aftermath was strange. Although Popper was at first widely read and indignantly denounced, it later became bad form among Marxists and classicists to mention him by

name. Yet, to an extraordinary extent, in the following decades his work set the agenda for apologetic Platonists, Hegelians and Marxists. In many cases a book or article makes most sense when seen as covertly engaged in trying to confute some point Popper made in *The Open Society.*

As a teacher of philosophy, Popper displayed ambivalence: philosophical problems emerge from science, so the best preparation was an education in a first-order subject, preferably scientific. In the classroom, he had the charisma of one possessed by intellectual problems, thinking about them all the time. In lecture or seminar he could be intellectually fierce and confrontational, in personal encounter sweet and encouraging. He regularly displayed an astonishingly quick intuitive grasp of the logic of any position presented to him, even from the most meagre of clues, and an eagerness to strengthen and elaborate on it before setting about criticizing it. He thus exemplified the values he advocated: intellectual seriousness, personal responsibility and disinterestedness, that is, doing justice to ideas regardless of their temporary embodiment. The failure of much critical commentary to meet these standards lies behind his complaint of misrepresentation. But there are also other reasons. If Popper is correct, not only is much in the traditional way of doing philosophy misdirected, but even the questions are wrongly put. Any attempt to map Popper's ideas into traditionally oriented discussions risks misrepresentation. The frequent practice of reconstructing Popper's philosophy timelessly, plucking materials from works published as far apart as fifty years, flies in the face of his emphasis on the structuring role of problems and problem-situations in all intellectual activity, particularly inquiry. To do justice to the originality and creativity of his work, scholarship needs in the first instance to respect its intellectual context of production.

POPULATION AND ETHICS

Ethical concern with population policies and with the issue of optimal population size is, generally speaking, a modern phenomenon. Although the first divine injunction of the Bible is 'be fertile and multiply', systematic theoretical interest in the normative aspects of demography has become associated largely with recent developments which have provided humanity with unprecedented control over population size, mainly through medical and economic means. Once the determination of the number of people in the world is no longer a natural given fact, but rather a matter of individual or social choice, it becomes subject to moral evaluation.

However, the extension of traditional ethical principles to issues of population policies is bedevilled by paradoxes. The principle of utility, the ideal of self-perfection, the idea of a contract as a basis for political legitimacy and social justice, the notion of natural or human rights, and the principle of respect for persons – all these presuppose the existence of human beings whose interests, welfare, rights and dignity are to be protected and promoted. But population policies deal with the creation of people and the decision concerning their number. They relate to the creation of the very conditions for the application of ethical principles. And it need not be just their number – advances in genetics and reproductive technology may soon bring what sort of people they are to be to some extent under human control.

PORNOGRAPHY

There are three main questions about pornography. (1) How is pornography to be defined? Some definitions include the contention that it is morally wrong, while others define it neutrally in terms of

its content and function. (2) Why is it wrong? Some accounts see the moral wrong of pornography in its tendency to corrupt individuals or to have detrimental effects on the morality of society; other accounts declare pornography to be objectionable only in so far as it causes physical harm to those involved in its production, or offence to unwilling observers. (3) Should pornography be restricted by law? Controversy here centres around whether the law should be used to discourage immorality, and whether the importance of free speech and individual autonomy are such as to rule out legislating against pornography. Here, the pornography debate raises very general questions about law and about autonomy in liberal societies.

PORPHYRY (*c.*233–309 AD)

The late ancient philosopher Porphyry was one of the founders of Neoplatonism. He edited the teachings of Plotinus into the form in which they are now known, clarified them with insights of his own and established them in the thought of his time. But, in reaction to Plotinus, he also advanced the cause of Aristotle's philosophical logic. Indeed, Porphyry is responsible for the resurgence of interest in Aristotle, which continued to the Middle Ages and beyond. Because of Porphyry, later Greek philosophy recovered both its Platonic and its Aristotelian roots, and Neoplatonism aimed to combine inspired thought with academic precision.

He was a scholar of great learning, with interests ranging from literary criticism and history to religion. An example is his defence of vegetarianism, which anticipated the modern debate on ecological preservation. Humans and animals belong to the same family. Seeking to preserve life is a matter of extending philanthropy and respect to all living species, which are our natural siblings. Ideally we ought to display 'harmlessness' even towards plants, except that our bodies, being composite and mortal, need to consume something else for food. Thus we should be ever conscious of the destructive effect that our eating habits and consumerism have on the creation of which we are part, and should try to keep to a simple lifestyle.

Porphyry's attention to logic, metaphysics and all other topics was driven by his firm belief that reason exercised by pure mind leads to the true essence of things, the One God. Intellectual activity detaches the soul from passions and confusions, and concentrates its activity on the real things. Porphyry attacked Christianity and Gnosticism because he thought they appealed to the irrational. Mysteries and rituals are fitted for those who are unable to practise inward contemplation. Salvation comes to those leading the life of the philosopher-priest.

POSITIVISM

See COMTE, ISIDORE-AUGUSTE-MARIE-FRANÇOIS-XAVIER; LEGAL POSITIVISM; LOGICAL POSITIVISM; POSITIVISM IN THE SOCIAL SCIENCES

POSITIVISM IN THE SOCIAL SCIENCES

Positivism originated from separate movements in nineteenth-century social science and early twentieth-century philosophy. Key positivist ideas were that philosophy should be scientific, that metaphysical speculations are meaningless, that there is a universal and a priori scientific method, that a main function of philosophy is to analyse that method, that this basic scientific method is the same in both the natural and social sciences, that the various sciences should be reducible to physics, and that the theoretical parts of good science must be translatable into statements about observations. In the social sciences and the philosophy of the social sciences, positivism has supported the emphasis on quantitative data and precisely formulated theories, the doctrines of behaviourism, operationalism and methodological individualism, the doubts among philosophers that meaning and interpretation can be scientifically adequate, and an approach to the philosophy of social science that focuses on conceptual analysis rather than on the actual practice of social research. Influential criticisms have denied that scientific method is a priori or universal, that theories can or must be translatable into observational terms, and that reduction to physics is the way to unify the sciences. These criticisms have undercut the motivations for behaviourism and methodological individualism in the social sciences. They have also led many to conclude, somewhat implausibly, that any standards of good social science are merely matters of rhetorical persuasion and social convention.

HAROLD KINCAID

POSSIBLE WORLDS

The concept of possible worlds arises most naturally in the study of possibility and necessity. It is relatively uncontroversial that grass might have been red, or (to put the point another way) that there is a possible world in which grass is red. Though we do not normally take such talk of possible worlds literally, doing so has a surprisingly

large number of benefits. Possible worlds enable us to analyse and help us understand a wide range of problematic and difficult concepts. Modality and modal logic, counterfactuals, propositions and properties are just some of the concepts illuminated by possible worlds.

Yet, for all this, possible worlds may raise more problems than they solve. What kinds of things are possible worlds? Are they merely our creations or do they exist independently of us? Are they concrete objects, like the actual world, containing flesh and blood people living in alternative realities, or are they abstract objects, like numbers, unlocated in space and time and with no causal powers? Indeed, since possible worlds are not the kind of thing we can ever visit, how could we even know that such things exist? These are but some of the difficult questions which must be faced by anyone who wishes to use possible worlds.

JOSEPH MELIA

POSTCOLONIALISM

The term 'postcolonialism' is sometimes spelled with a hyphen – post-colonial – and sometimes without. There is no strict general practice, but the hyphenated version is often used to refer to the condition of life after the end of colonialism while the non-hyphenated version denotes the theory that attempts to make sense of this condition. The term is regularly used to denote both colonialism and imperialism even though these refer to different historical realities.

Like postmodernism and poststructuralism, postcolonialism designates a critical practice that is highly eclectic and difficult to define. It involves a studied engagement with the experience of colonialism and its past and present effects at the levels of material culture and of representation. Postcolonialism often involves the discussion of experiences such as those of slavery, migration, suppression and resistance, difference, race, gender, place and analysis of the responses to the discourses of imperial Europe, such as history, philosophy, anthropology and linguistics. Since conditions under imperialism and colonialism proper are as much the subject of postcolonialism as those coming after the historical end of colonialism, postcolonialism allows for a wide range of applications and a constant interplay between the sense of an historical transition, a cultural location and an epochal condition. Postcolonialism is seen to pertain as much to conditions of existence in former colonies as to conditions in diaspora. Both are frequently linked to the continuing power and authority of the West in the global political, economic and symbolic spheres and the ways in which resistance to, appropriation of and negotiation with the West's order are prosecuted. However the term is construed, there is as much focus on the discourse and ideology of colonialism as on the material effects of colonial subjugation. Because it has its source in past and continuing oppression, postcolonialism furthermore has affinities with multicultural, feminist, and gay and lesbian studies.

ATO QUAYSON

POSTMODERNISM

The term 'postmodernism' appears in a range of contexts, from academic essays to clothing advertisements in the *New York Times*. Its meaning differs with context to such an extent that it seems to function like Lévi-Strauss' 'floating signifier': not so much to express a value as to hold open a space for that which exceeds expression. This broad capacity of the term 'postmodernism' testifies to the scope of the cultural changes it attempts to compass.

Across a wide range of cultural activity there has been a sustained and multivalent challenge to various founding assumptions of Western European culture since at least the fifteenth century and in some cases since the fifth century BC: assumptions about structure and identity, about transcendence and particularity, about the nature of time and space. From physics to philosophy, from politics to art, the description of the world has changed in ways that upset some basic beliefs of modernity. For example, phenomenology seeks to collapse the dualistic distinction between subject and object; relativity physics shifts descriptive emphasis from reality to measurement; the arts move away from realism; and consensus politics confronts totalitarianism and genocide. These and related cultural events belong to seismic changes in the way we register the world and communicate with each other.

To grasp what is at stake in postmodernism it is necessary to think historically and broadly, in the kind of complex terms that inevitably involve multidisciplinary effort. This multilingual impetus, this bringing together of methods and ideas long segregated both in academic disciplines and in practical life, particularly characterizes postmodernism and largely accounts for such resistance as it generates.

Although diverse and eclectic, postmodernism can be recognized by two key assumptions. First, the assumption that there is no common

denominator – in 'nature' or 'truth' or 'God' or 'the future' – that guarantees either the One-ness of the world or the possibility of neutral or objective thought. Second, the assumption that all human systems operate like language, being self-reflexive rather than referential systems – systems of differential function which are powerful but finite, and which construct and maintain meaning and value.

ELIZABETH DEEDS ERMARTH

POST-STRUCTURALISM

Introduction

Post-structuralism is a late-twentieth-century development in philosophy and literary theory, particularly associated with the work of Jacques Derrida and his followers. It originated as a reaction against structuralism, which first emerged in Ferdinand de Saussure's work on linguistics. By the 1950s structuralism had been adapted in anthropology (Lévi-Strauss), psychoanalysis (Lacan) and literary theory (Barthes), and there were hopes that it could provide the framework for rigorous accounts in all areas of the human sciences.

Although structuralism was never formulated as a philosophical theory in its own right, its implicit theoretical basis was a kind of Cartesianism, but without the emphasis on subjectivity. It aimed, like Descartes, at a logically rigorous system of knowledge based on sharp explicit definitions of fundamental concepts. The difference was that, for structuralism, the system itself was absolute, with no grounding in subjectivity. Post-structuralist critiques of structuralism typically challenge the assumption that systems are self-sufficient structures and question the possibility of the precise definitions on which systems of knowledge must be based.

Derrida carries out his critique of structuralist systems by the technique of deconstruction. This is the process of showing, through close textual and conceptual analysis, how definitions of fundamental concepts (for example, presence versus absence, true versus false) are undermined by the very effort to formulate and employ them. Derrida's approach has particularly influenced literary theory and criticism in the USA. In addition, Richard Rorty, developing themes from pragmatism and recent analytic philosophy, has put forward a distinctively American version of post-structuralism.

1 Structuralism

In his lectures on linguistics, Ferdinand de SAUSSURE proposed a view of language (*langue*) as a formal structure, defined by differences between systemic elements. According to Saussure, this structure is simultaneously present in and unites the two domains of thought and words. A given linguistic term (a sign) is the union of an idea or concept (the 'signified') and a physical word (the 'signifier'). A language is a complete system of such signs, which exists not as a separate substance but merely as the differentiating form that defines the specific structure of both signifiers (physical words) and signifieds (ideas). Saussure's view rejects the common-sense picture of the set of signifiers and the set of signifieds as independent givens, with the signifieds having meaning in their own right and the signifiers obtaining meaning entirely through their association with corresponding signifieds. Saussure denies this independence and instead maintains that signifiers and signifieds alike have meaning only in virtue of the formal structure (itself defined by differences between elements) that they share (see STRUCTURALISM IN LINGUISTICS).

Saussure's structuralist approach was very successful within linguistics, where it was applied and extended by, among others, Jakobson and Troubetzkoy. By the 1950s the approach had been adapted in anthropology (Lévi-Strauss), psychoanalysis (Lacan) and literary theory (Barthes); and there were hopes that it could provide the framework for rigorous accounts in all areas of the human sciences. Three distinguishing features of this framework were: (1) a rejection of all idealist views of concepts and meanings as derived from the activity of consciousness; (2) an understanding of concepts and meanings as, instead, grounded in the structural relations among the elements of abstract systems; (3) an explication of such structural relations solely in terms of bipolar differences (for example, real/unreal, temporal/nontemporal, present/absent, male/female).

2 Post-structuralism: terminology

Post-structuralism is obviously closely tied to structuralism, but commentators have characterized the relationship in a variety of mutually inconsistent

ways. Some writers make no distinction between structuralism and post-structuralism, applying the single term 'structuralist' to the entire range of thinkers from Saussure through to Derrida. More commonly, post-structuralism is distinguished as a separate development, but there is disagreement as to whether it is primarily a reaction against structuralism or an extension of it (as the term *Neostrukturalismus*, commonly used by Manfred Frank and other German commentators, suggests). Apart from matters of definition, there is even disagreement as to whether major figures such as Barthes, Lacan and Foucault are structuralists or post-structuralists.

Michel Foucault's book, *Les Mots et les choses* (translated under the title *The Order of Things*) is an instructive example. In one sense it is quintessentially structuralist. The book first uncovers the fundamental epistemic systems (which Foucault calls 'epistemes') that underlie and delimit the subjective thought of particular eras. It then goes on to show how the apparent ultimacy of subjectivity is itself just the product of one contingent episteme, that of modernity, which is even now disappearing (the famous 'death of man'). Nevertheless, Foucault's essentially historical viewpoint in the work demonstrates the limitation of structuralism: its inability to give any account of the transitions from one system of thought to another. Foucault seems to have seen from the beginning that structuralism cannot be historical, a fact that explains his constant insistence that he was not a structuralist, in spite of his obvious deployment of structuralist methods and concepts. So, although *Les Mots et les choses* is a structuralist book, it at the same time makes clear the limits of structuralism and prepares the way for Foucault's later work on power and ethics which is distinctly post-structuralist (see Foucault, M.).

Despite these ambiguities and disagreements, the concept of post-structuralism is useful, if not essential, for understanding philosophy in France during the latter part of the twentieth century. One fruitful approach is to think of post-structuralism as a philosophical reaction to the structuralism that was such a powerful force during the 1960s in linguistics, psychology and the social sciences. It was neither a simple rejection or extension of structuralism but a series of philosophical reflections on the structuralist programme and achievement.

3 Two major post-structuralist theses

Although structuralism was never formulated as a philosophical theory in its own right, its implicit theoretical basis was, as noted above, a kind of Cartesianism without the subject. (Hence, the association of structuralism with the notion of the 'death of the subject'.) Post-structuralist critiques of structuralism are typically based on two fundamental theses: (1) that no system can be autonomous (self-sufficient) in the way that structuralism requires; and (2) that the defining dichotomies on which structuralist systems are based express distinctions that do not hold up under careful scrutiny.

The first thesis is not understood so as to support the traditional idealist view that systematic structures are dependent on the constitutive activities of subjects. Post-structuralists retain structuralism's elimination of the subject from any role as a foundation of reality or of our knowledge of it. But, in opposition to structuralism, they also reject any logical foundation for a system of thought (in, for example, its internal coherence). For post-structuralists, there is no foundation of any sort that can guarantee the validity or stability of any system of thought.

The second thesis is the key to post-structuralism's denial of the internal coherence of systems. The logical structure of a system requires that the applications of its concepts be unambiguously defined. (In the formalism of elementary number theory, for example, there must be no question as to whether a given number is odd or even.) As a result, the possibility of a systematic structure depends on the possibility of drawing sharp distinctions between complementary concepts such as odd/even, charged/uncharged, living/non-living, male/female and so on. Post-structuralist philosophers have been particularly concerned with the fundamental dichotomies (or oppositions) underlying structuralist theories in the human sciences. Saussure's linguistics, for example, is based on the distinction of the signifier from the signified; Lévi-Strauss's anthropology of myths employs oppositions such as raw/cooked, sun/moon and so on. In each case, post-structuralists have argued that the dichotomy has no absolute status because the alternatives it offers are neither exclusive nor exhaustive.

4 Derrida's critique of logocentrism

This sort of critique was extended to philosophy, particularly by Jacques Derrida, who finds Western philosophical thought pervaded by a network of oppositions – appearance/reality, false/true, opinion/knowledge, to cite just a few examples – that constitute what he calls the system of 'logocentrism'. This term derives from Derrida's conviction that at the root of Western philosophical thought is a fundamental distinction between speech (*logos*) and writing. Speech is privileged as the expression of what is immediate and present, the

source, accordingly, of what is real, true and certain. Writing, on the other hand, is derogated as an inferior imitation of speech, the residue of speech that is no longer present and, therefore, the locus of appearance, deceptions and uncertainty. Plato's devaluation of writing in comparison with living dialogue is the most famous and influential example of this distinction. But Derrida finds the distinction pervading Western philosophy and regards it as not just a preference for one form of communication over another but the basis for the entire set of hierarchical oppositions that characterize philosophical thought. Speech offers presence, truth, reality, whereas writing, a derivative presentation employed in the absence of living speech, inevitably misleads us into accepting illusions.

Derrida's critiques of the speech/writing opposition – and of all the hierarchical oppositions that attend it – proceed by what he calls the method of 'deconstruction' (see Deconstruction). This is the process of showing, through close textual and conceptual analysis, how such oppositions are contradicted by the very effort to formulate and employ them. Consider, for example, the opposition between presence and absence, which plays a fundamental role in Husserl's phenomenology (and many other philosophical contexts). Husserl requires a sharp distinction between what is immediately present to consciousness (and therefore entirely certain) and what is outside of consciousness (and therefore uncertain). But once Husserl undertakes a close analysis of the immediately present, he discovers that it is not instantaneous but includes its own temporal extension. The 'present', as a concrete experiential unit, involves both memory of the just-immediately-past (retention, in Husserl's terminology) and anticipation of the immediate future (protention). Thus, the past and the future, both paradigms of what is absent (not present), turn out to be integral parts of the present. Husserl's own account of the presence/absence opposition overturns it.

Deconstruction maintains that there is no stability in any of thought's fundamental oppositions. Their allegedly exclusive alternatives turn out to be inextricably connected; their implicit hierarchies perpetually reversible. As a result, there is an ineliminable gap between the intelligibility of a rational system and the reality it is trying to capture. Derrida expresses this gap through a variety of terms. He frequently speaks of *différance* (a deliberately misspelled homophone of the French *différence*) to emphasize, first, the difference between systematic structures and the objects (for example, experiences, events, texts) they try to make intelligible, and, second, the way in which efforts to make absolute distinctions are always deferred (another sense of the French *différer*) by the involvement of one polar opposite in the other. This latter phenomenon Derrida also discusses in terms of the 'trace' of its opposite always lingering at the heart of any polar term. He also employs the term 'dissemination' to refer to the way that objects of analysis slip through the conceptual net spread by any given system of intelligibility we devise for it.

5 Post-structuralism and literary theory

Thus far the discussion has focused on Derrida's deconstruction of the meaningful structures philosophers purport to find in reality and to express in their philosophical texts. But Derrida's approach is also readily applicable to literary texts (and the 'worlds' they create). This is because – like philosophical systems – poems, novels and other literary texts are typically thought to embody complete and coherent systems of meaning, which it is the task of literary criticism to extract. Although Derrida himself has dealt primarily with philosophical texts, his approach has been widely adopted by analysts of literature. (Of course, as should be expected, Derrida and his followers reject any sharp distinction between the philosophical and the literary.)

Traditional literary analysis has understood the meaning of a text as the expression of its author's mind; that is, as thoughts the author intended to convey in writing the text. The first stage of deconstructive criticism is the structuralist one of detaching meaning from authorial intention, locating it instead in the text itself as a linguistic structure. Roland Barthes, for example, showed how to analyse a text by Balzac entirely in terms of the formal codes it embodies, with no reference to what Balzac supposedly 'meant'. This structuralist move effects a 'death of the author' parallel to the anti-Cartesian 'death of the subject'. But the post-structuralists take the future step of denying a fixed meaning to even the autonomous text itself. It is not that a text lacks all meaning but that, on the contrary, it is the source of an endless proliferation of conflicting meanings. As deconstructionists delight in showing, any proposed privileged meaning of a text can be undermined by careful attention to the role in it of apparently marginal features. (For example, an orthodox Christian reading of Milton's *Paradise Lost* is deconstructed by a close study of certain details in its treatment of Satan.) There is no doubt, of course, that texts are often produced by authors trying to express what they think or feel. But what they write always goes beyond any authorial intention and in ways that can never be reduced to a coherent system of meaning.

The deconstructionist's point can also be understood as an undermining of the distinction between primary text and commentary. On the traditional view, a commentary is an effort to formulate as accurately as possible the content (meaning) of the text. To the extent that it is successful, a commentary expresses nothing more and nothing less than this meaning. But for deconstructionists the meaning in question does not exist, and the commentary must be understood as nothing more than a free elaboration of themes suggested, but not required, by the text. Unable to be a secondary reflection, the commentary becomes as much an independent creation as the text itself.

6 Rorty's post-structuralist pragmatism

Richard Rorty's work is far removed, in both antecedents and style, from that of continental post-structuralists (see Rorty, R.M.). His critique of Cartesianism, derived more from Dewey than from Heidegger, is aimed at twentieth-century analytic philosophy rather than the structuralist human sciences; and his urbanely lucid prose contrasts sharply with the wilfully playful convolutions of Derrida and his followers. None the less, Rorty's analyses lead him to a critique of traditional philosophy very similar to that of the post-structuralists.

The focal point of Rorty's critique is the project (called foundationalism) of providing a philosophical grounding for all knowledge. Modern foundationalism originates with Descartes, but Rorty sees it as also the *leitmotif* of Descartes' successors, through Hume and Kant down to the logical positivists. Like Derrida, Rorty attacks traditional systematic thought by calling into question some of its key distinctions. Unlike Derrida, however, he does not carry out his attacks through close readings of classic texts but by deploying the results of recent analytic philosophy. He uses, for example, Quine's critique of the distinction between analytic and synthetic statements to argue that there are no foundational truths about the meaning of concepts. He appeals to Wilfrid Sellars' undermining of the distinction between theory and observation to reject empirical foundations of knowledge in interpretation-free sense data. He employs Donald Davidson's questioning of the distinction between the formal structure and the material content of a conceptual framework to reject Kantian attempts to ground knowledge in principles that define the framework of all possible thought.

In Rorty's view the upshot of these various critiques is to cut off every source of an ultimate philosophical foundation for our knowledge. Accordingly, he maintains, philosophy must give up its traditional claim to be the final court of appeal in disputes about truth. We have no alternative but to accept as true what we (the community of knowers) agree on. There is no appeal beyond the results of the 'conversation of mankind' so far as it has advanced to date. For us, there is no (upper-case) Truth justified by privileged insights and methods. There is only the mundane (lower-case) truth: what our interlocutors let us get away with saying.

It might seem that this rejection of foundationalism is a rejection of the entire tradition of Western philosophy since Plato. Rorty, however, distinguishes two styles of philosophy. First, there is *systematic philosophy*, the mainline of the Western tradition since Plato, which is defined by the foundationalist goal of ultimate justification. But, on the other hand, there is another enterprise, always marginal to the tradition, that Rorty calls *edifying philosophy*. Whereas systematic philosophers undertake elaborate and purportedly eternal constructions (which are always demolished by the next generation), edifying philosophers are content to shoot ironic barbs at the systematic thought of their day, exploding its pretensions and stimulating intriguing lines of counter-thought. The tradition of edifying thought can be traced back at least to the ancient Cynics and has been more recently represented by Kierkegaard, Nietzsche and the later Wittgenstein. Derrida's deconstructions are, on Rorty's view, a prime contemporary example of edifying philosophy.

Edifying philosophers, however, are philosophers only because they react against systematic philosophy. They do not differ from other sorts of cultural critics (novelists, literary theorists, social scientists) because of any distinctively philosophical method or viewpoint. If, in the wake of thinkers such as Derrida and Rorty, systematic philosophy is abandoned, philosophy will be too. The triumph of post-structuralism would, for better or worse, be the end of philosophy as we have known it.

PRACTICAL REASON AND ETHICS

Introduction

Practical reason is reasoning which is used to guide action, and is contrasted with theoretical reason, which is used to guide thinking. Sometimes 'practical reason' refers to any way of working out what to do; more usually it refers to proper or authoritative, hence *reasoned*, ways of working out what to do.

On many accounts practical reasoning is solely instrumental: it identifies ways of reaching certain results or ends, but has nothing to say about which ends should be pursued or which types of action are good or bad, obligatory or forbidden. Instrumental reasoning is important not only for ethics and politics, but for all activities, for example, in working out how to travel to a given destination.

Other accounts of practical reason insist that it is more than instrumental reasoning: it is concerned not only with working out how to achieve given ends, but with identifying the ethically important ends of human activity, or the ethically important norms or principles for human lives, and provides the basis for all ethical judgment.

No account of objective ethical values can be established without showing how we can come to know them, that is, without showing that some form of *ethical cognitivism* is true. However, ethical cognitivism is not easy to establish. Either we must show that some sort of intuition or perception provides direct access to a realm of values; or we must show that practical reasoning provides less direct methods by which objective ethical claims can be established. So anybody who thinks that there are directly objective values, but doubts whether we can intuit them directly, must view a plausible account of practical reason as fundamental to philosophical ethics.

1 Introduction

Most ethical positions or theories rely on one or more conceptions of practical reason, yet many fail to explicate, let alone to vindicate, the particular conceptions on which they rely. The only positions or theories which offer no account of practical reason are those which construe ethical claims either as noncognitive or as based directly on particular cognitions such as perceptions or intuitions that do not need to be linked to any reasoning process (see Analytic ethics; Emotivism; Intuitionism in ethics; Moral realism).

One pervasive disagreement among the proponents of various accounts of practical reason is between those who think that practical reasons should both justify and motivate action and those who think that they should justify, but need not motivate. The claim that reasons both justify and motivate is often labelled *internalism*, the thought being that anything that motivates (whether a desire, or a certain sort of belief, or some other internal state) must be internal to the agent who is motivated. The claim that reasons must justify but need not motivate is correspondingly termed *externalism* (see Moral motivation §§1–2). Broadly speaking, internalists think that externalists fail to show how reason can be practical, since they do not adequately address the question of motivation, and externalists think that internalists lose sight of the fact that practical reason must be reasoned, since they build an account of the contingencies of motivation into their account of reason. There are many versions both of internalism and of externalism.

Accounts of practical reasoning can be grouped under two very general headings. Many accounts of practical reason are *end-oriented* (also known as *teleological* or *consequentialist*): they seek to show how reason can select action (also attitudes and policies)

that will contribute to certain ends or results (see CONSEQUENTIALISM; TELEOLOGICAL ETHICS). Many proponents of end-oriented practical reasoning think that practical reason can do no more. Since no objective account of the proper ends of human life can be found, we must settle for *subjective* accounts of human ends. We must agree with Hume that reason 'is, and ought only to be the slave of the passions' (*A Treatise of Human Nature* 1739–40) (see RATIONALITY, PRACTICAL). However, there are other accounts of end-oriented practical reasoning which insist that reason can also identify certain *objective* ends, and so has the dual task of identifying the proper ends of action and guiding action towards those ends.

Yet other conceptions of practical reason do not view it as focused solely on ends and means to those ends. *Act-oriented* accounts of practical reason take it that action (also attitudes and policies) are guided by norms or principles, and that it is the task of practical reason to identify appropriate, reasoned norms and principles. Some norms and principles formulate very general ends, others point to quite specific acts: the Jesuit maxim 'For the greater glory of God' defines the end of an entire life; the homely advice 'Do not eat oysters unless there is a letter "r" in the name of the month' offers limited and specific advice. Although some norms and principles define ends, norm- and principle-guided reasoning cannot be assimilated to end-oriented reasoning, which sees all practical reasoning as bearing on a means-ends complex. Act-oriented reasoning sees it as bearing on practical propositions (norms, rules, principles) and as guiding action without reference either to supposed objective ends or to the subjective ends of any agents.

Many accounts of act-oriented reasoning see it as norm-based: they take it that the fundamental ethical orientations (norms, categories, commitments, beliefs, senses of identity: hereafter *norms*) accepted in a society or tradition, or in an individual's life, provide the fundamental premises for practical reasoning. On such accounts, practical reasoning is internal to societies: it appeals to the norms that constitute the bedrock of certain lives or ways of life, so cannot coherently be brought into question by those who live these lives.

Other critical accounts of act-oriented ethical reasoning object that uncritical appeal to accepted norms cannot provide acceptable premises for practical reasoning; arguing from accepted norms is quite arbitrary, hence quite unreasoned. Any conclusions reached in this way will be relative to the assumed norms, so can support no more than one or another version of ethical relativism (see MORAL RELATIVISM). Exponents of critical accounts of practical reason think that adequate act-oriented reasoning must offer reasons which do not presuppose any specific norms (or traditions, or identities), but rather must be public in the sense that they are relevant to an unrestricted audience, or, as Kant put it vividly in an early version of this thought, that they must 'address . . . the world at large' (*An Answer to the Question: 'What is Enlightenment?'* 1784). The possibility of vindicating any critical, universal conception of act-oriented practical reason is questioned by proponents of other conceptions.

The search for a convincing account of practical reason raises issues fundamental not only to ethics and politics, but to a wide range of philosophical problems. They include the problem of seeing whether, and if so how, any account of practical reason can be vindicated without begging questions, the connection between practical and theoretical reason and the problem of showing how and how far various conceptions of practical reason can guide action, attitudes or policies.

2 End-oriented reasoning: reason is instrumental

Scepticism about the idea that reason has any objective ends of its own was put succinctly by Hume, who scoffed that ''tis not contrary to reason to prefer the destruction of the whole world to the scratching of my finger' (*A Treatise of Human Nature* 1739–40), insisted that ''tis in vain to pretend, that morality is discover'd only by a deduction of reason' and concluded that *ought* cannot be derived from *is*. If morality has no ends that are discovered by reason, then practical reason's only task is to show how the pursuit of the passions – of subjective ends – is to be organized effectively and efficiently. The central task of practical reason is the instrumental one of deploying our knowledge of causal relations to guide action: practical reason is simply an application of and derivative from aspects of theoretical reason; it needs no separate justification.

There is, however, a great deal to be said about the detailed operations of instrumental reasoning. In particular, if some metric can be found for the ends which are to be sought (for example, if there is a metric for the satisfaction of desires or preferences), and if the probabilities of achieving various ends can be quantified, then instrumental reasoning can be used to show which available actions maximize the satisfaction of preferences, and hence how given ends can be pursued efficiently. If this metric permits the desires or preferences of different persons to be measured using a common unit, practical reasoning may be able to guide social as well as individual decision-making and policy. Utilitarian ethical theory, game theory and a wide

range of economic and social calculi have discussed numerous versions of subjective, end-oriented practical reasoning which are held to be appropriate for various contexts (see RATIONALITY, PRACTICAL; RATIONAL CHOICE THEORY; UTILITARIANISM.)

Merely instrumental accounts of practical reason have been criticized at least since Kant. The critics do not doubt that instrumental reasoning is a necessary aspect of practical reasoning, but they insist that it cannot be sufficient. All that it provides is an account of the use of empirical, and in particular causal, knowledge in pursuit of intrinsically arbitrary ends. Instrumental reasoners may show that it is necessary to break eggs if one wants to make an omelette, but they have nothing but preferences to cite as reasons for making or not making omelettes: all their conclusions are conditional on subjective ends. Instrumental reasoning in pursuit of individual preferences can support efficient egoism, or strategic thinking or certain limited and distinctively modern conceptions of prudence: but this is all it can do (see MORAL MOTIVATION §§4–6).

Contemporary work on instrumental reasoning has addressed this criticism up to a point by insisting that practical reasoning requires not only that choices of action be instrumentally sound, but that they be based on well-ordered (for example, connected and transitive) preference-orderings. However, since these coherence conditions can be met by many different sets of preferences, the requirement of well-orderedness provides little further reasoned guidance. It does not add enough to an account of instrumental rationality to satisfy those who think that an account of practical reason should provide a more complete guide to reasoned choice, or to rebut the charge that instrumental reasoning gets no further than showing how intrinsically arbitrary (unreasoned) ends are to be pursued by rational means.

Some advocates of subjective end-oriented practical reasoning have held that desires and preferences, although subjective, provide an approximation to an objective account of the good. Some utilitarians, for example, have held that happiness is the sole good, that it is achieved by satisfying desires, and that therefore the optimal satisfaction of desires leading to maximal happiness produces the greatest good; they then claim that instrumental reasoning provides a sufficient account of practical reasoning for ethical as well as for egoistical, strategic and merely prudential purposes. Critics have countered that happiness is not the sole good, and moreover that it is not all of a sort, and cannot be aggregated, so that instrumental reasoning alone will not be enough to guide ethical choice. Others have objected that some sorts of happiness, such as happiness in the satisfaction of evil desires, or happiness produced by violating others' rights, does not contribute to the good at all, and conclude that the instrumentally rational pursuit of happiness cannot be what ethics demands.

3 End-oriented reasoning: reason identifies objective ends

All of these difficulties would be resolved if reason could also identify objective ends. Instrumental reasoning is only one aspect of an older and more ambitious conception of end-oriented practical reasoning, which claims that reason both identifies the proper ends of action – the good – and can be used to steer action towards those ends. Such a position can be attributed to PLATO, on whose account reason not merely can know its proper object, the [Form of the] Good, but strives for the Good. Far from being inert, reason is intrinsically active, and has its own desires and its own end. In this picture there is no gap between theoretical reason, which guides right cognition, and practical reason, which guides right action. Human knowledge and desire have a common focus on the Good; *nous* and *eros* are aspects of one capacity, and the remaining practical problem is to align human life as that capacity directs.

The metaphysical and epistemological claims needed to support this more traditional vision of practical reason are hugely ambitious. Yet despite the difficulty of justifying objective conceptions of end-oriented practical reason, it has been widely accepted in varied forms. Aristotle, for example, took issue with Plato's unitary conception of the Good, and insisted that there are many goods, but held that they include the Good for man, which constitutes the proper end for human action (see ARISTOTLE §§20–1; EUDAIMONIA). He offers a complex account of supplementary patterns of practical reasoning which can be used to identify action that contributes to the good for man. These include the *doctrine of the mean*, which purportedly offers a nonmechanistic way of selecting 'intermediate' action, so avoiding unacceptable extremes, and the so-called *practical syllogism*, by which conclusions about action (or possibly actions themselves) are inferred from general principles and claims about particular situations. Many later Neoplatonist and Christian thinkers also combine the ideas that the Good can be known by reason and that it is the proper end of human life. Plato's teleological view of reason has been widely if tacitly shared by countless other writers who neither share his metaphysical position nor provide any alternative, but who speak of certain ends as 'reasonable'

without much by way of explanation, and often with far less by way of defence than Plato offers.

Of course, knowing what the Good is – what the true ends of human life are – is never enough to guide action. The effective pursuit of these ends also requires the use of reason to calculate which of various available acts contributes to those ends most effectively, as well as to identify any actions, attitudes or policies that are components of those ends. However, by itself this calculating, predominantly instrumental, side of end-oriented practical reason, as discussed in §2, cannot guide action without assuming subjective ends.

4 Act-oriented reasoning: reason appeals to norms

Other accounts of practical reason hold that it must guide action without reference either to subjective ends (because its conclusions would then be conditional on something wholly arbitrary) or to objective ends (because there is none). An adequate account of practical reason must bear more directly on action, and more specifically on the practical propositions (norms, rules, principles) which agents follow or embody in their lives. Just as theoretical reasoning prescribes ways of moving between elements that have syntactic and semantic structure, so too must practical reasoning. The central problem in using any act-oriented conception of practical reason for ethical purposes is to show *why* some but not other norms or principles, and so some but not other types of action and ends, attitudes and policies, are either good or ethically required.

Many forms of act-oriented practical reasoning maintain that the basis for distinguishing certain types of action from others can be found in the categories, beliefs and norms that form the constitutive elements of a society or of a sense of identity. These constitutive norms cannot be brought into question by anyone for whom they constitute the horizons of life and thought, so can provide basic premises for reasoning about what is good or bad, required or forbidden.

Once some fundamental norms have been identified, practical reasoning can be extended both by instrumental reasoning and by analysing the logical connections and implications between different norms (for example, between requirements, prohibitions and permissions) and the structure of systems of norms. At its most formal this sort of analysis draws on deontic logic; less formal conceptual investigations of types and systems of rules have also been undertaken, particularly by philosophers of law (see Deontic logic). However, since act-oriented practical reasoning does not provide any metric for ends it cannot use the maximizing patterns of practical reasoning which some subjective forms of end-oriented reasoning favour.

Norm-based practical reasoning is uncontroversially part and parcel of daily life, but philosophical argument that it is the basis for all ethical reasoning is highly controversial. Arguments that all ethical reasoning appeals to norms can be found in the work of Hegel, in historicist, communitarian and relativist writing, and (in more individualistic forms) in work by Wittgensteinians and by Bernard Williams.

Hegel's view that there is no gap between *is* and *ought* expresses not the implausible thought that whatever is accepted is acceptable, that (contrary to Hume) *ought* can be generally be derived from *is*, but the more profound view that all thinking and action must grow not out of abstract theories and principles but out of the deep structures of our actual situations (Hegel's term is *Sittlichkeit*, often translated as *ethical life*) (see Hegel, G.W.F. §8). The deep facts of our histories and lives are ones that we cannot 'go behind' and bring into question; rather they form the inescapable framework of our action, and so constitute legitimate, indeed unavoidable, starting points for all practical, including ethical, reasoning.

Similar positions can be found in Wittgenstein and in certain Wittgensteinians. In Wittgenstein's assertion that 'there must be agreement… in judgments' (*Philosophical Investigations* 1953: para. 242) and in the widespread view that certain issues are 'not a matter for decision', we see further versions of the thought that certain categories and norms form inescapable frameworks for life and thought, and that those who live within them lack any external vantage point from which to question or undermine them. More individualistic versions of the same approach can be found in Bernard Williams' contention that certain identity-constituting personal projects and commitments are part of the framework which reasoning must assume, so cannot query (see Williams, B.A.O.)

Practical reasoning which appeals to constitutive norms, coupled with ordinary patterns of instrumental reasoning, has powerful means of guiding action at its disposal. Critics fear, however, that this power is bought too dearly. One alleged cost is that norm-based practical reasoning is supposedly conservative: it will always already have presupposed established (usually establishment) categories, norms, identities and commitments, and provides no vantage point from which they can be criticized. This criticism is rebutted by many proponents of norm-based reasoning who, like Hegel, point out that any constitutive norm, sense of identity or the

like will be but part of a wider set of beliefs and norms, whose elements can be used to challenge, revise and renew one another. Once norms and identities are seen in developmental, historical context there is no reason to suppose that practical reasoning that starts from those of a given place and time must be intrinsically conservative.

Perhaps a more worrying criticism of norm-based practical reasoning is that even if it is not intrinsically conservative, it is nevertheless unavoidably designed for those who have internalized a certain outlook and its categories and norms: it is insiders' reasoning. For outsiders, treating insiders' shared categories and norms, and the established practices and identities they support, as bedrock for practical reasoning lacks all justification, because it adopts arbitrary premises. Like instrumental reasoning, norm-based reasoning can at best reach conditional conclusions. Its advocates can only retort that there is no external vantage available from which these starting points can be rebutted or called into question.

5 *Act-oriented reasoning: reason appeals to 'the world at large'*

If act-oriented reasoning is to escape the confines and the criticisms which it incurs by treating socially specific categories and norms as the bedrock for ethical reasoning, then it must find some way of 'going behind' and criticizing these assumptions.

The classic version of a critical conception of act-oriented practical reasoning was developed by Immanuel Kant, who held that reasoning should address 'the world at large' (that is, all reasoners) rather than the limited groups who share specific but intrinsically arbitrary norms and practices (Kant, *An Answer to the Question* and *What is Orientation in Thinking?*; O'Neil 1989 part I). If practical reasoning is to meet this standard, its first requirement must be the rejection of any principles which cannot be adopted by all, regardless of their social background, their accepted categories and norms, their established practices, their senses of identity or their desires (see UNIVERSALISM IN ETHICS). Kant summarized this requirement in the words: 'Act only on that maxim through which you can at the same time will that it should be a universal law' (*Grundlegung zur Metaphysik der Sitten* 1785). He claims that this principle of practical reason provides the supreme principle of morality, and should be called the 'categorical imperative' because it is the only way of reasoning practically which does not introduce arbitrary assumptions, and so the only one that can reach unconditional, namely categorical, conclusions. The component norms of social traditions and senses of identity may be scrutinized using the categorical imperative; if they cannot be willed as universal laws they must be rejected as unreasoned.

Kant's attempt to vindicate this critical account of practical reasoning is based on the thought that anything which deserves to be called reasoning must be something that can be given or received, exchanged or followed, among the widest 'public', that is universally, and correspondingly that anything which invokes the norms and beliefs of limited groups, let alone the favoured projects of individual lives, calls for rather than provides reasons. The authority of reason is simply the requirement of living by fundamental principles that are fit for universal use (in other words, that are *lawlike*). Since we know no intrinsic sources of authoritative standards – we have no account of the objectively good – the only meagre authority with which we are left is the injunction to reject principles which cannot be principles for all.

Once this fundamental use of practical reason has been used to identify certain core ethical principles or rules, critical practical reasoning can be extended by some of the moves used by instrumental and norm-based practical reasoning. Kant insists that instrumental reasoning is indispensable (although he cannot reinstate the metric assumptions or maximizing calculi advocated by those who hinge reasoning on subjective ends). He speaks of instrumental reasoning as guided by the principle of the 'hypothetical imperative', since by itself it can only licence conditional conclusions. His full account of practical reasoning also relies on the transitions between different modalities of required action (for example, between claims about obligations, permissions and prohibitions) that are used in norm-based reasoning.

There are many passages in which Kant indicates that the principles of theoretical and practical reason are fundamentally the same (such as in *Grundlegung*). However in his case this appears to be the result neither of the derivation of practical from theoretical reason (as in instrumental reasoning) nor of the fusion of theory and practice (as in Platonism) but because his vindication of reason unites practical and theoretical reason (see O'Neill 1989 part II).

Kant's vindication of practical reason is controversial, and its adequacy as a guide to action is even more so. Since Hegel criticized Kant, many commentators have concluded that this stripped-down conception of practical reason is simply not enough to guide action, or alternatively that it will guide it in the 'wrong' direction. Some object that virtually any principle can be universally adopted and that this account of practical reason is not robust enough to guide action; others object (with little plausibility) that the universality requirement makes rigidly uniform demands and leaves no room for the differentiation of action which human life requires.

These classic (and incompatible) objections are respectively said to target empty 'formalism' and insensitive 'rigourism' (see O'Neill 1989 part II).

Kantian conceptions of practical reason have recently been taken up in two bodies of literature. Some writers have returned to Kant to look for more plausible interpretations of the procedures by which his conception of practical reason can guide action (see O'Neill 1989 part II) and to explicate his distinctive vindication of practical reason (see O'Neill 1989 part I). Others have offered a range of contemporary interpretations of the idea that the fundamental feature of practical reason is its capacity to be public (see Rawls 1993).

6 Other aspects of practical reason

Few, if any, accounts of practical reason claim to offer a total guide for action (the exception may be certain utilitarian versions of subjective end-oriented reasoning, which supposedly reduce everything to calculation). Most insist that good practical reasoning must be linked with careful empirical reasoning, and that it will also need judgment to determine the specific way in which an end should be pursued or a norm or principle instantiated (see MORAL JUDGMENT). There is general acceptance of the point (emphasized by both Kant and Wittgenstein) that rules cannot provide instructions for their own application, and must be supplemented by judgment. Real life appeals to instrumental reasoning, to socially specific norms and to abstract principles, are all inevitably indeterminate and must be augmented with judgment.

Reasoning practically is always a task rather than an automatic process, and there are therefore many ways in which it can fail. Some are cognitive failures (due, for example, to mistaken views about causal links or risks); others are closely linked to questions about motivation. Some central types of failure in practical reasoning have been the subject of extensive study (see AKRASIA).

PRAGMATICS

Analytic philosophers have made lasting contributions to the scientific study of language. Semantics (the study of meaning) and pragmatics (the study of language in use) are two important areas of linguistic research which owe their shape to the groundwork done by philosophers.

Although the two disciplines are now conceived of as complementary, the philosophical movements out of which they grew were very much in competition. In the middle of the twentieth century, there were two opposing 'camps' within the analytic philosophy of language. The first – 'ideal language philosophy', as it was then called – was that of the pioneers, Frege, Russell and the logical positivists. They were, first and foremost, logicians studying formal languages and, through these formal languages, 'language' in general. Work in this tradition (especially that of Frege, Russell, Carnap, Tarski and later Montague) gave rise to contemporary *formal semantics*, a very active discipline developed jointly by logicians, philosophers and grammarians. The other camp was that of so-called 'ordinary language philosophers', who thought important features of natural language were not revealed, but hidden, by the logical approach initiated by Frege and Russell. They advocated a more descriptive approach, and emphasized the 'pragmatic' nature of natural language as opposed to, for example, the 'language' of *Principia Mathematica*. Their own work (especially that of Austin, Strawson, Grice and the later Wittgenstein) gave rise to contemporary pragmatics, a discipline which (like formal semantics) has developed successfully within linguistics in the past thirty years.

From the general conception put forward by ordinary language philosophers, four areas or topics of research emerged, which jointly constitute the core of pragmatics: speech acts; indexicality and context-sensitivity; non-truth-conditional aspects of meaning; and contextual implications. Looking at these topics from the point of view of ordinary language philosophy, pragmatics is seen as an *alternative* to the truth-conditional approach to meaning associated with ideal language philosophy (and successfully pursued within formal semantics). Looking at them from a contemporary point of view, pragmatics merely *supplements* that approach.

FRANÇOIS RECANATI

PRAGMATISM

Introduction

Pragmatism is a philosophical tradition founded by three American philosophers: Charles Sanders Peirce, William James and John Dewey. Starting from Alexander Bain's definition of belief as a rule or habit of action, Peirce argued that the function of inquiry is not to represent reality, but rather to enable us to act more effectively. He was critical of the 'copy theory' of knowledge which had dominated philosophy since the time of Descartes, and especially of the idea of immediate, intuitive self-knowledge. He was also a prophet of the linguistic turn, one of the first philosophers to say that the ability to use signs is essential to thought.

Peirce's use of Bain was extended by James, whose *The Principles of Psychology* (1890) broke with the associationism of Locke and Hume. James went on, in *Pragmatism* (1907) to scandalize philosophers by saying that '"The true" . . . is only the expedient in our way of thinking'. James and Dewey both wanted to reconcile philosophy with Darwin by making human beings' pursuit of the true and the good continuous with the activities of the lower animals – cultural evolution with biological evolution. Dewey criticized the Cartesian notion of the self as a substance which existed prior to language and acculturation, and substituted an account of the self as a product of social practices (an account developed further by George Herbert Mead).

Dewey, whose primary interests were in cultural, educational and political reform rather than in specifically philosophical problems (problems which he thought usually needed to be dissolved rather than solved), developed the implications of pragmatism for ethics and social philosophy. His ideas were central to American intellectual life throughout the first half of the twentieth century.

All three of the founding pragmatists combined a naturalistic, Darwinian view of human beings with a deep distrust of the problems which philosophy had inherited from Descartes, Hume and Kant. They hoped to save philosophy from metaphysical idealism, but also to save moral and religious ideals from empiricist or positivist scepticism. Their naturalism has been combined with an anti-foundationalist, holist account of meaning by Willard van Orman Quine, Hilary Putnam and Donald Davidson – philosophers of language who are often seen as belonging to the pragmatist tradition. That tradition also has affinities with the work of Thomas Kuhn and the later work of Ludwig Wittgenstein.

1 Classical pragmatism

Charles Sanders PEIRCE, William JAMES and John DEWEY – often referred to as the three 'classical pragmatists' – had very different philosophical concerns. Except for their shared opposition to the correspondence theory of truth, and to 'copy theories' of knowledge, their doctrines do not overlap extensively (see TRUTH, PRAGMATIC THEORY OF). Although each knew and respected the other two, they did not think of themselves as belonging to an organized, disciplined philosophical movement. Peirce thought of himself as a disciple of Kant, improving on Kant's doctrine of categories and his conception of logic. A practising mathematician and laboratory scientist, he was more interested in these areas of culture than were James or Dewey. James took neither Kant nor Hegel very seriously, but was far more interested in religion than either Peirce or Dewey. Dewey, deeply influenced by Hegel, was fiercely anti-Kantian. Education and politics, rather than science or religion, were at the centre of his thought.

Peirce was a brilliant, cryptic and prolific polymath, whose writings are very difficult to piece together into a coherent system. He is now best known as a pioneer in the theory of signs, and for work in logic and semantics contemporaneous with, and partially paralleling, that of Frege. Peirce's account of inquiry as a matter of practical problem-solving was complemented by his criticisms of the Cartesian (and empiricist) idea of 'immediate knowledge', and of the project of building knowledge on self-evident foundations (of either a rationalist or empiricist kind).

Peirce protested against James' appropriation of his ideas, for complex reasons to do with his obscure and idiosyncratic doctrine of 'Scotistic realism' – the reality of universals, considered as potentialities or dispositions. Peirce was more sympathetic to metaphysical idealism than James, and found James' version of pragmatism simplistic and reductionist. James himself, however, thought of pragmatism as a way of avoiding reductionism of all kinds, and as a counsel of tolerance. Particularly in his famous essay 'The Will to Believe' (1896), he attempted to reconcile science and religion by viewing both as instruments useful for distinct, non-conflicting purposes.

Although he viewed many metaphysical and theological disputes as, at best, exhibitions of the

diversity of human temperament, James hoped to construct an alternative to the anti-religious, science-worshipping positivism of his day. He approvingly cited Giovanni Papini's description of pragmatism as 'like a corridor in a hotel. Innumerable chambers open out of it. In one you may find a man writing an atheistic volume; in the next someone on his knees praying for faith; in a third a chemist investigating a body's properties . . . they all own the corridor, and all must pass through it'. His point was that attention to the implications of beliefs for practice offered the only way to communicate across divisions between temperaments, academic disciplines and philosophical schools.

Dewey, in his early period, tried to bring Hegel together with evangelical Christianity. Although references to Christianity almost disappear from his writings around 1900, in a 1903 essay on Emerson he still looked forward to the development of 'a philosophy which religion has no call to chide, and which knows its friendship with science and with art'. The anti-positivist strain in classical pragmatism was at least as strong as its anti-metaphysical strain, and so James and Dewey found themselves attacked simultaneously from the empiricist left and from the idealist right – by Bertrand RUSSELL as well as by F.H. BRADLEY. Both critics thought of the pragmatists as fuzzy and jejune thinkers. This sort of criticism was repeated later in the century by the disciples of CARNAP, most of whom dismissed the classical pragmatists as lacking in precision and argumentative rigour.

James wrote a few remarkable essays on ethics – notably 'The Moral Philosopher and the Moral Life' (1891), in which, echoing Mill's *Utilitarianism*, he says that every desire and need has a *prima facie* right to be fulfilled, and that only some competing desire or need can provide a reason to leave it unsatisfied. But neither James nor Peirce attempted any systematic discussion of moral or political philosophy. Dewey, however, wrote extensively in this area throughout his life – from *Outlines of a Critical Theory of Ethics* (1891) to *Human Nature and Conduct* (1922) and *Theory of Valuation* (1939).

Dewey urged that we make no sharp distinction between moral deliberation and proposals for change in sociopolitical institutions, or in education (the last being a topic on which he wrote extensively, in books which had considerable impact on educational practice in many countries). He saw changes in individual attitudes, in public policies and in strategies of acculturation as three interlinked aspects of the gradual development of freer and more democratic communities, and of the better sort of human being who would develop within such communities. All of Dewey's books are permeated by the typically nineteenth-century conviction that human history is the story of expanding human freedom and by the hope of substituting a less professionalized, more politically oriented conception of the philosopher's task for the Platonic conception of the philosopher as 'spectator of time and eternity'.

In *Reconstruction in Philosophy* (1920) he wrote that 'under disguise of dealing with ultimate reality, philosophy has been occupied with the precious values embedded in social traditions. . . . has sprung from a clash of social ends and from a conflict of inherited institutions with incompatible contemporary tendencies'. For him, the task of future philosophy was not to achieve new solutions to traditional problems, but to clarify 'men's ideas as to the social and moral strifes of their own day'. This conception of philosophy, which developed out of Hegel's and resembled Marx's (see HEGEL, G.W.F.; MARX, K.), isolated Dewey (particularly after the rise of analytic philosophy) from colleagues who thought of their discipline as the study of narrower and more precise questions – questions that had remained substantially unchanged throughout human history.

2 *Pragmatism after the linguistic turn*

Peirce was one of the first philosophers to emphasize the importance of signs. 'The word or the sign which man uses *is* the man himself,' he wrote, ' . . . my language is the sum total of myself; for the man is the thought'. But, with the exception of C.I. LEWIS and Charles Morris, philosophers did not take Peirce's work on signs very seriously. Indeed, for decades Peirce remained largely unread: he had never published a philosophical book, and most of his articles were collected and republished only in the 1930s.

By that time philosophy in the English-speaking world was already in the process of being transformed by admirers of Frege, notably Carnap and Russell. These philosophers accomplished what Gustav Bergmann was to baptize 'the linguistic turn' in philosophy. They thought that it would be more fruitful, more likely to yield clear and convincing results, if philosophers were to discuss the structure of language rather than, as Locke and Kant had, the structure of the mind or of experience. The early analytic philosophers, however, accompanied this turn with a revival of the traditional empiricist idea that sense-perception provides foundations for empirical knowledge – an idea which, at the beginning of the century, the idealists and the classical pragmatists had united in rejecting. These philosophers also insisted on a strict distinction between conceptual questions (the

analogue of Kant's 'transcendental' questions), now reinterpreted as questions about the meaning of linguistic expressions, and empirical questions of fact.

It was not until that distinction was questioned by Willard van Orman Quine in his groundbreaking 'Two Dogmas of Empiricism' (1951) that pragmatism was able once again to obtain a hearing (see QUINE, W.V. §8). James and Dewey had been viewed during the heyday of logical positivism as having prefigured the logical positivist's verifiability criterion of empirical meaningfulness, but as unfortunately lacking the powerful analytic tools which the new logic had made available. However, Quine's suggestion that empirical observation of linguistic behaviour could not detect a difference between necessary, analytic truths and contingent, synthetic, yet unquestioned truths helped revive the pragmatists' combination of holism, anti-foundationalism and naturalism.

That suggestion was reinforced by other publications which were roughly simultaneous with Quine's. In *Philosophical Investigations* (1953), Ludwig Wittgenstein mocked the idea that logic is both 'something sublime' and the essence of philosophy, an idea which the younger Wittgenstein had shared with Russell (see WITTGENSTEIN, L.J.J. §8). That book also reinvigorated the pragmatists' claim that most philosophical problems should be dissolved rather than solved. Wilfrid Sellars' 'Empiricism and the Philosophy of Mind' (1953) renewed both Peirce's assault on the idea of 'immediate experience' and his claim that the intentionality of the mental is derived from the intentionality of the linguistic, rather than conversely (see SELLARS, W.S.). In America, this article had the same devastating effect on the notion of 'sense-datum', and thus on the empiricist roots of logical positivism, that J.L. Austin's work was simultaneously having in Britain (see AUSTIN, J.L.). The work of Sellars and Austin conspired to deprive empiricism of the prestige which it had traditionally enjoyed in the Anglophone philosophical world.

Somewhat later, Thomas Kuhn's *The Structure of Scientific Revolutions* (1962) broke the grip of the positivist notion that natural science, because it offered paradigmatically rational methods and procedures, should be imitated by the rest of culture (see KUHN, T.S.). The effect of these various anti-empiricist and anti-positivist writings was to make many post-positivistic analytic philosophers sympathetic to Dewey's suspicions of the Cartesian-Kantian problematic of modern philosophy. Hilary PUTNAM, the best-known contemporary philosopher to identify himself as a pragmatist, has written appreciatively about all three classical pragmatists, praising their refusal to distinguish 'the world as it is in itself' from the world as it appears in the light of human needs and interests.

On Putnam's account in his *The Many Faces of Realism* (1987), 'the heart of pragmatism . . . was the insistence on the agent point of view. If we find that we must take a certain point of view, use a certain 'conceptual system', when we are engaged in practical activity. . . then we must not simultaneously advance the claim that it is not really the way things are in themselves'. Putnam holds that our moral judgments are no more and no less 'objective' than our scientific theories, and no more and no less rationally adopted. He agrees with Dewey that the positivists' attempt to separate 'fact' from 'value' is as hopeless as their pre-Quinean attempt to separate 'fact' from 'language'.

Putnam has also come to the defence of the most notorious and controversial of the classical pragmatists' doctrines: the so-called 'pragmatist theory of truth'. Peirce said 'the opinion which is fated to be ultimately agreed to by all who investigate is what we mean by the truth, and the object represented in this opinion is the real'. Putnam has revived this idea, arguing that even if we cannot follow Peirce in *defining* 'true' as 'idealized rational assertibility', the latter notion is, as a regulative ideal, inseparable from an understanding of the concept of truth. He has criticized the correspondence theory of truth by arguing that any such correspondence of a belief to reality can only be to reality under a particular description, and that no such description is ontologically or epistemologically privileged. Putnam follows Nelson Goodman in saying that 'there is no one Way the World Is'.

3 Pragmatism as anti-representationalism

Putnam is chary, however, of endorsing James' claim that '"The true" . . . is only the expedient in the way of our thinking, as "the right" is only the expedient in our way of behaving'. That formulation was attacked by James' contemporaries as at worst an invitation to self-deception, and at best a confusion of truth with justifiability. Dewey tried to avoid the controversy by ceasing to use the word 'truth', and speaking instead of 'warranted assertibility'. But this did not shield him from charges of confusion and inconsistency. Russell, reviewing Dewey, said that 'there is a profound instinct in me which is repelled by [Dewey's] instrumentalism: the instinct of contemplation, and of escape from one's own personality'. He and many other critics complained that pragmatism is unable to take account of the eternity and absoluteness of truth – of the fact that a sentence that contains no demonstratives is, if true, true in utter independence of changes in human needs or purposes. Putnam's treatment of truth is

designed to avoid the appearance of relativism, and to escape such strictures as Russell's.

Despite its paradoxical air and its apparent relativism, however, James' claim does bring out pragmatism's strongest point: its refusal to countenance a discontinuity between human abilities and those of other animals. Pragmatists are committed to taking Darwin seriously. They grant that human beings are unique in the animal kingdom in having language, but they urge that language be understood as a tool rather than as a picture. A species' gradual development of language is as readily explicable in Darwinian terms as its gradual development of spears or pots, but it is harder to explain how a species could have acquired the ability to *represent* the universe – especially the universe as it really is (as opposed to how it is usefully described, relative to the particular needs of that species).

In a weak sense of 'represent', of course, an earthworm or a thermostat can be said to contain 'representations of the environment', since there are internal arrangements in both which are responsible for the reactions of each to certain stimuli. But it makes little sense to ask whether those representations are *accurate*. Philosophers who take epistemological scepticism seriously (as pragmatists do not) have employed a stronger sense of 'representation', one in which it does make sense to ask whether the way in which it best suits human purposes to describe the universe is an accurate representation of the universe as it is in itself (see SCEPTICISM).

The idea that knowledge is accurate representation and the idea that reality has an intrinsic nature are inseparable, and pragmatists reject both. In rejecting these ideas pragmatists are rejecting the problematic of realism and antirealism – the question of whether there is or is not a 'matter of fact' about, for example, mathematics or ethics, whether beliefs in these areas are attempts to correspond to reality. Whatever may be said about truth, pragmatists insist, we cannot make sense of the notion of 'correspondence', nor of that of 'accurate representation of the way things are in themselves' (see TRUTH, CORRESPONDENCE THEORY OF).

Donald DAVIDSON is the philosopher of language whose work is most reminiscent of the classical pragmatists' attempts to be faithful to Darwin. Davidson has said that 'Beliefs are true or false, but they represent nothing. It is good to be rid of representations, and with them the correspondence theory of truth, for it is thinking that there are representations that engenders thoughts of relativism' ('The Myth of the Subjective' 1989). He has argued that we need to get rid of what he calls 'the third dogma of empiricism', the distinction between the mind or language as organizing scheme, and something else (for example, the sensible manifold, the world) as organized content – the Kantian version of the dualism of subject and object (see 'On the Very Idea of a Conceptual Scheme' 1974). In 'A Nice Derangement of Epitaphs' (1986), an attempt to radicalize and extend Quine's naturalistic approach to the study of linguistic behaviour, he has suggested that we 'erase the boundary between knowing a language and knowing our way about in the world generally', and that 'there is no such thing as a language, not if a language is anything like what many philosophers and linguists have supposed'.

Davidson does not wish to be called a pragmatist, however, since he equates pragmatism with unfeasible attempts to reduce truth to some form of assertibility, thereby making it an epistemic concept, rather than a merely semantic one. Unlike Peirce and Putnam, Davidson thinks that we should treat 'true' as a primitive term, and should neither attempt to revitalize the correspondence theory of truth nor replace it with a better theory of truth. Davidson's strategy is summed up in his recommendation that we not say 'that truth is correspondence, coherence, warranted assertibility, ideally justified assertibility, what is accepted in the conversation of the right people, what science will end up maintaining, what explains the convergence on single theories in science, or the success of our ordinary beliefs' ('The Structure and Content of Truth' 1990). We should, he says in the same article, not offer an analysis of the meaning of 'true', but rather confine ourselves to describing 'the ultimate source of both objectivity and communication', namely, 'the triangle that, by relating speaker, interpreter and the world determines the contents of thought and speech'. The trouble with the correspondence theory, on Davidson's view, is that it cuts out the 'interpreter' side of the triangle, and treats truth as relation of 'matching' between speaker and world.

If one follows Davidson's advice, one can give up the pragmatist theory of truth without giving up the Darwinian naturalism which that theory was a paradoxical-sounding attempt to articulate. Such naturalism, however, entails an abandonment of much of the problematic of contemporary philosophy. If truth is never the name of a relation ('corresponding', 'representing', 'getting right', 'fitting') which holds between sentences and non-sentences, there is no point in asking whether this relation holds for some true sentences (for example, perceptual reports or scientific theories) and not for others (for example, sentences about numbers or values). On this latter point, Putnam and Davidson are in agreement (see TRUTH, CORRESPONDENCE THEORY OF).

Michael DUMMETT has suggested, plausibly, that the problematic of realism and antirealism is at the heart of the Western philosophical tradition (see REALISM AND ANTIREALISM). If he is right, and if Davidson is right in thinking that we should now abandon that problematic, then James' and Dewey's suggestions about how to end the traditional and seemingly sterile quarrels between materialists and idealists, positivists and metaphysicians, theists and atheists, science-worshippers and poetry-worshippers, look more promising. The heart of both men's pragmatism was not any particular doctrine about the nature of truth, of knowledge, or of value, but rather the hope that philosophy could renew itself by moving out from under traditional dualisms (subject–object, mind–world, theory–practice, morality–prudence) which recent science and recent social changes had, they believed, rendered obsolete.

The classical pragmatists saw themselves as responding to Darwin in the same way as the great philosophers of the seventeenth and eighteenth centuries had responded to Galileo and Newton. Philosophers such as Descartes, Locke and Kant attempted to accommodate old, precious, moral and spiritual aspirations to new scientific developments. James and Dewey thought that these attempts had been made obsolete by Darwin's new account of the origin of our species, and that fresh attempts were needed. If one reads Quine's and Davidson's naturalization of semantics as a continuation of philosophy's attempt to come to terms with Darwin, one can also read these two philosophers as continuing the larger enterprise which James and Dewey inaugurated.

4 Pragmatism and humanity's self-image

By stepping back from its relation to traditional empiricism on the one hand and to the linguistic turn on the other, one can put pragmatism in a larger context. Much twentieth-century philosophy has been devoted to a criticism of the view, shared by Plato and Aristotle, that a capacity to know things as they really are is central to being human. Philosophers influenced by Nietzsche – notably Heidegger, SARTRE and DERRIDA – have argued against the idea that cognition is the distinctively human capacity. Heidegger's treatment of inquiry as a species of coping, in his discussion of *Vorhandenheit* in *Being and Time* (1927), has much in common with Dewey's and Kuhn's attempts to see scientific progress as problem-solving – as the overcoming of obstacles to the satisfaction of human needs, rather than as convergence towards a special, specifically cognitive, relation to reality. Both Dewey and HEIDEGGER saw the Greek quest for certainty as debilitating. Neither granted the traditional assumption that, in addition to all the other needs human beings have, there is a need to know the truth.

Heidegger's criticism of what he called 'onto-theology' – Western philosophy viewed as a series of attempts to find solace and support in the non-temporal – has much in common with Dewey's criticism of what he called 'intellectualism'. Both of these men saw the tradition which begins with Plato as a self-deceptive attempt to give the eternal priority over the temporal. So did BERGSON and WHITEHEAD, the founders of the tradition known as 'process philosophy', a tradition to which James (especially in his *Essays in Radical Empiricism*) made important contributions (see PROCESS PHILOSOPHY). This downgrading of the eternal is characteristic of a great deal of twentieth-century philosophy. It is found in James' criticisms of Bradley, in Putnam's criticism of Bernard Williams' claim that we can use an 'absolute conception of the world' as a regulative ideal of inquiry, in Heidegger's criticism of Husserl, and in Derrida's criticism of Heidegger.

Downgrading eternity means downgrading both the idea of truth as eternal and the assumption that knowledge of eternal truth is the distinctively human activity. From a Davidsonian, as from a Deweyan, point of view, the only point of the doctrine that truth is eternal is to contrast truth with justification (which is obviously neither eternal nor absolute, because it is relative to the composition of the audience to which justification is offered, and thus to historical circumstance). But that contrast can be formulated without treating 'truth' as the name of a goal to be reached, or as an object to be admired. Davidson's treatment of truth forbids us to think of inquiry as subject to a norm of acquiring true beliefs, in addition to the norm of providing adequate justification. There is no way to seek for truth apart from seeking for justification. Justification gets better as the community to which justification is offered becomes more sophisticated and complex, more aware of possible sources of evidence and more capable of dreaming up imaginative new hypotheses and proposals. So pragmatists place the capacity to create complex and imaginative communities at the centre of their image of humanity, superseding the ability to know. Dewey and Putnam agree that the aim of inquiry is what Putnam calls 'human flourishing' – the kind of human life which is possible in free, democratic, tolerant, egalitarian societies. These are the societies in which the arts and the sciences proliferate and progress, and within which idiosyncrasy is tolerated.

The obvious difference between James, Dewey and Putnam on the one hand and Nietzsche, Heidegger and Foucault on the other – between

the two most prominent sections of the twentieth-century revolt against the Greek self-image of humanity – is that these three Europeans do not share the Americans' enthusiasm for, and optimism about, liberal-democratic society. Nietzsche's, and the early Heidegger's, insistence on the resolute authenticity of the lonely individual, and their exaltation of will as opposed to intellect, are equally foreign to Dewey and to Putnam (though they have some echoes in certain passages of James). Rather than replace intellect by will, in the manner of SCHOPENHAUER, pragmatists tend to replace knowledge by love, in the manner of Kierkegaard's contrast between Socrates and Christ (see KIERKEGAARD, S.A.).

For Dewey, the pragmatist who speculated most daringly, and developed the greatest historical self-consciousness, the glory of human beings is their ability to become citizens of a liberal-democratic society, of a community which constantly strives to see beyond its own limits – both with an eye to the inclusion of presently excluded or marginalized human beings and with respect to innovative intellectual and artistic initiatives. This is the capacity which most clearly sets us apart from other animals. It presupposes, of course, the capacity to use language, but for Dewey the point of having language, and therefore thought, was not to penetrate through the appearances to the true nature of reality, but rather to permit the social construction of new realities. For him, language was not a medium of representation, but a way of coordinating human activities so as to enlarge the range of human possibilities. These processes of coordination and enlargement, which make up cultural evolution, do not have a destined terminus called the Good or the True, any more than biological evolution has a destined terminus called The Ideal Life-Form. Dewey's imagery is always of proliferating novelty, rather than of convergence.

The naturalist strain in pragmatism, the attempt to come to terms with Darwin, is thus from a Deweyan point of view important mainly as a further strategy for shifting philosophers' attention from the problems of metaphysics and epistemology to the needs of democratic politics. Dewey once said that he agreed with Plato that politics was 'the science of the whole', a remark which summarized the following train of reasoning. Finding out what there is is a matter of finding out what descriptions of things will best fulfil our needs. Finding out what needs we should fulfil is a task for communal reflection about what human beings might become. Such cooperative inquiry into the possibilities of self-transcendence is best accomplished within a democratic society. So philosophers should stop asking about the nature of reality or of knowledge, and instead try to strengthen and improve the institutions of such societies by clarifying 'men's ideas as to the social and moral strifes of their own day'.

PREDESTINATION

Predestination appears to be a religious or theological version of universal determinism, a version in which the final determining factor is the will or action of God. It is most often associated with the theological tradition of Calvinism, although some theologians outside the Calvinist tradition, or prior to it (for example, Augustine and Thomas Aquinas), profess similar doctrines. The idea of predestination also plays a role in some religions other than Christianity, perhaps most notably in Islam.

Sometimes the idea of predestination is formulated in a comparatively restricted way, being applied only to the manner in which the divine grace of salvation is said to be extended to some human beings and not to others. John Calvin, for example, writes:

> We call predestination God's eternal decree, by which he compacted with himself what he willed to become of each man. For all are not created in equal condition; rather, eternal life is foreordained for some, eternal damnation for others. Therefore, as any man has been created to one or the other of these ends, we speak of him as predestined to life or to death.
> (*Institutes*, bk 3, ch. 21, sec. 5)

At other times, however, the idea is applied more generally to the whole course of events in the world; whatever happens in the world is determined by the will of God. Philosophically, the most

interesting aspects of the doctrine are not essentially linked with salvation. For instance, if God is the first cause of all that happens, how can people be said to have free will? One answer may be that people are free in so far as they act in accordance with their own motives and desires, even if these are determined by God. Another problem is that the doctrine seems to make God ultimately responsible for sin. A possible response here is to distinguish between actively causing something and passively allowing it to happen, and to say that God merely allows people to sin; it is then human agents who actively choose to sin and God is therefore not responsible.

GEORGE I. MAVRODES

PREDICATE CALCULUS

The predicate calculus is the dominant system of modern logic, having displaced the traditional Aristotelian syllogistic logic that had been the previous paradigm. Like Aristotle's, it is a logic of quantifiers – words like 'every', 'some' and 'no' that are used to express that a predicate applies universally or with some other distinctive kind of generality, for example 'everyone is mortal', 'someone is mortal', 'no one is mortal'. The weakness of syllogistic logic was its inability to represent the structure of complex predicates. Thus it could not cope with argument patterns like 'everything Fs and Gs, so everything Fs'. Nor could it cope with relations, because a logic of relations must be able to analyse cases where a quantifier is applied to a predicate that already contains one, as in 'someone loves everyone'. Remedying the weakness required two major innovations.

One was a logic of connectives – words like 'and', 'or' and 'if' that form complex sentences out of simpler ones. It is often studied as a distinct system: the propositional calculus. A proposition here is a true-or-false sentence and the guiding principle of propositional calculus is truth-functionality, meaning that the truth-value (truth or falsity) of a compound proposition is uniquely determined by the truth-values of its components. Its principal connectives are negation, conjunction, disjunction and a 'material' (that is, truth-functional) conditional. Truth-functionality makes it possible to compute the truth-values of propositions of arbitrary complexity in terms of their basic propositional constituents, and so develop the logic of tautology and tautological consequence (logical truth and consequence in virtue of the connectives).

The other invention was the quantifier-variable notation. Variables are letters used to indicate things in an unspecific way; thus '*x* is mortal' is read as predicating of an unspecified thing *x* what 'Socrates is mortal' predicates of Socrates. The connectives can now be used to form complex predicates as well as propositions, for example '*x* is human and *x* is mortal'; while different variables can be used in different places to express relational predicates, for example '*x* loves *y*'. The quantifier goes in front of the predicate it governs, with the relevant variable repeated beside it to indicate which positions are being generalized. These radical departures from the idiom of quantification in natural languages are needed to solve the further problem of ambiguity of scope. Compare, for example, the ambiguity of 'someone loves everyone' with the unambiguous alternative renderings 'there is an *x* such that for every *y*, *x* loves *y*' and 'for every *y*, there is an *x* such that *x* loves *y*'.

The result is a pattern of formal language based on a non-logical vocabulary of names of things and primitive predicates expressing properties and relations of things. The logical constants are the truth-functional connectives and the universal and existential quantifiers, plus a stock of variables construed as ranging over things. This is 'the' predicate calculus. A common option is to add the identity sign as a further logical constant, producing the predicate calculus with identity. The first modern logic of quantification, Frege' in 1879, was designed to express generalizations not only about individual things but also about properties of individuals. It would nowadays be classified as a second-order logic, to distinguish it from the first-order logic described above. Second-order logic is much richer in expressive power than first-order logic, but at a price: first-order logic can be axiomatized, second-order logic cannot.

PRESCRIPTIVISM

Prescriptivism is a theory about moral statements. It claims that such statements contain an element of meaning which serves to prescribe or direct actions. The history of prescriptivism includes Socrates, Aristotle, Hume, Kant and Mill, and it has been influential also in recent times.

Moral statements also contain a factual or descriptive element. The descriptive element of morality differs between persons and cultures, but the prescriptive element remains constant.

Prescriptivism can allow for moral disagreement, and explain moral weakness. It can also explain

better than other theories the rationality and objectivity of moral thinking.

R.M. HARE

PRESOCRATIC PHILOSOPHY

The Presocratics were the first Western philosophers. The most celebrated are Thales, Anaximander, Pythagoras, Heraclitus, Parmenides, Zeno of Elea, Empedocles, Anaxagoras and Democritus. Active in Greece throughout the sixth and fifth centuries BC, they concentrated on cosmogony and cosmology – the tasks of explaining the world's origin and order, without recourse to mythology.

Socrates (469–399 BC) is perceived as marking a watershed in philosophy – a shift of focus from the origin and nature of the universe to human values. 'Presocratic' philosophy thus represents the era intellectually antecedent to Socrates, even though its exponents included contemporaries of his (some his juniors). Those thinkers contemporary with Socrates who shared his concentration on human values it is better not to call Presocratic (see SOPHISTS). No complete Presocratic text survives. We have only later writers' quotations ('fragments'), summaries, criticisms, and so on, from which to glimpse the originals.

A mythological construction of the world was already integral to the earliest poetry familiar to the Greeks (*c*.700 BC). Philosophers' rationalizations of this picture concentrated initially on such questions as what the world's primeval stuff is, why the earth remains stable and, more generally, what made the world orderly. In time *kosmos* ('ordering'), came to mean 'world'. To explain cosmic order, biological, mechanical and even political models were developed. However, Presocratic philosophy was interested equally in the human soul and its destiny (see PSYCHĒ), and never altogether ignored human values. Another dominant issue was the possibility of human knowledge.

The main movements and phases were as follows. The three sixth-century BC Milesian philosophers, starting with Thales, were monists: each posited a single primeval stuff – for example, water, air. These came to function not just as the world's originative stuff but also perhaps as its enduring substrate (see ARCHĒ; THALES; ANAXIMANDER; ANAXIMENES; MONISM).

Pythagoreanism, although a secretive movement with cultic leanings, was highly influential throughout this era. Beyond a concern with the soul and survival, it promoted a mathematicizing approach to cosmology (see PYTHAGORAS; PYTHAGOREANISM).

Heraclitus (*c*.540–480 BC) kept the formal focus on the cosmos and the soul, but his approach was largely governed by metaphysical concerns, especially the paradoxical interdependence of opposites (see HERACLITUS). Metaphysics and logic took centre stage soon after in the Eleatic movement, initiated by PARMENIDES and continued by ZENO OF ELEA and Melissus. Eleaticism was a radical critique of ordinary notions of being, defending instead a strict monism which outlawed all phenomenal distinctions and changes as illusory (see also GORGIAS).

The later fifth-century BC cosmologists sought to deflect this Eleatic critique. Most were pluralists, positing more than one underlying element. Their contributions culminated in the atomic system of DEMOCRITUS, which reduced all reality to atoms and void, conceding much to Eleaticism (see ATOMISM, ANCIENT; EMPEDOCLES; LEUCIPPUS)

Presocratic philosophy is often seen as materialistic. However, no philosopher before Leucippus and Democritus reduced life and intelligence to something inanimate. Previous Presocratics considered these ineliminably present in things – either as already intrinsic to the primordial stuff(s) or, in Anaxagoras' system, by virtue of an irreducible dualism of mind and matter.

PRESUPPOSITION

There are various senses in which one statement may be said to 'presuppose' another, senses which are in permanent danger of being confused. Prominent among them are Strawsonian presupposition, a relation which obtains between statements when the falsity of one deprives the other of truth-value (for example, 'There was such a person as Kepler' is a Strawsonian presupposition of 'Kepler died in misery'); semantic presupposition, which obtains between a statement and a particular use of a sentence type, when the falsity of the statement

means that that use will not after all constitute the making of a statement (for example, 'The name "Kepler" has a bearer' is a semantic presupposition of 'Kepler died in misery'); and pragmatic presupposition, a broader notion exemplified by the legitimate presumption that accepting or denying the statement 'Fred knows that the earth moves' means accepting 'The earth moves'.

IAN RUMFITT

PRIMARY–SECONDARY DISTINCTION

The terminology of 'primary and secondary qualities' is taken from the writings of John Locke. It has come to express a position on the nature of sensory qualities – those which we attribute to physical objects as a result of the sensuous character of sensations they produce when they are perceived correctly by us. Since our senses can be differentiated from each other by the type of sensations they produce, sensory qualities are what Aristotle called 'proper sensibles' – those perceptible by one sense only. Colours, sounds, scents and tastes are always regarded as proper to their respective senses. What are the proper sensibles of touch, and whether there is similarly a single family of them, is a matter of controversy; but temperature at least is standardly regarded as proper to this sense. It is such sensory qualities that are candidates for being given the status of secondary qualities.

To regard sensory qualities as secondary is to hold that an object's possession of one is simply a matter of its being disposed to occasion a certain type of sensation when perceived; the object in itself possesses no sensuous character. Primary qualities, by contrast, are those which characterize the fundamental nature of the physical world as it is in itself. They are always taken to include geometrical attributes, and often some space-occupying feature; Locke's candidate for this latter was solidity. Although the terminology dates from the seventeenth century, this general doctrine goes back to the Greek atomists.

PRINCIPLE OF CHARITY

See Charity, principle of

PRIOR, ARTHUR NORMAN (1914–69)

Prior is most often thought of as the creator of tense logic. (Tense logic examines operators such as 'It will be the case that' in the way that modal logic examines 'It must be the case that'.) But his first book was on ethics, and his views on metaphysical topics such as determinism, thinking, intentionality, change, events, the nature of time, existence, identity and truth are of central importance to philosophy. Using methods akin to Russell's in his Theory of Descriptions, Prior showed that times, events, facts, propositions and possible worlds were logical constructions. For example, we get rid of events by recognizing among other things that to say that the event of Caesar's crossing the Rubicon took place later than the event of Caesar's invading Britain is to say that it has been the case that both Caesar is crossing the Rubicon and it has been the case that Caesar is invading Britain. The title of the posthumous work, *Worlds, Times and Selves* (1977), indicates the breadth and depth of his thought. He is also fun to read. Prior died at the age of fifty-four, at the height of his powers.

C.J.F. WILLIAMS

PRIVACY

The distinction between private and public is both central to much legal and political thought and subject to serious challenge on philosophical, practical and political grounds by critics of the status quo. Privacy – the state of being withdrawn from the world, free from public attention, interference or intrusion – is a cherished social value that is being offered ever more protection. Increasingly, laws require people to respect the privacy of others: privacy is recognized as a fundamental right in international documents and national constitutions, and recent customs and social norms forbid intrusions that were once accepted. The concept of privacy is also widely abused: it has been used to justify private racial discrimination and state neglect of domestic violence, as well as social abdication of general economic welfare through *laissez-faire* policies and the so-called privatization of social services. Critique of the public–private distinction is an important part of many critical theories, especially feminism and critical legal theory. These critics object that the public–private distinction is exaggerated, manipulable or incoherent.

PRIVATE LANGUAGE ARGUMENT

Ludwig Wittgenstein argued against the possibility of a private language in his 1953 book *Philosophical Investigations*, where the notion is outlined at §243: 'The words of this language are to refer to what can

be known only to the speaker; to his immediate, private, sensations. So another cannot understand the language.' The idea attacked is thus of a language in principle incomprehensible to more than one person because the things which define its vocabulary are necessarily inaccessible to others; cases such as personal codes where the lack of common understanding could be remedied are hence irrelevant.

Wittgenstein's attack, now known as the private language argument (although just one of many considerations he deploys on the topic), is important because the possibility of a private language is arguably an unformulated presupposition of standard theory of knowledge, metaphysics and philosophy of mind from Descartes to much of the cognitive science of the late twentieth century.

The essence of the argument is simple. It is that a language in principle unintelligible to anyone but its user would necessarily be unintelligible to the user also, because no meanings could be established for its signs. But, because of the difficulty of Wittgenstein's text and the tendency of philosophers to read into it their own concerns and assumptions, there has been extensive and fundamental disagreement over the details, significance and even intended conclusion of the argument. Some, thinking it obvious that sensations are private, have supposed that the argument is meant to show that we cannot talk about them; some that it commits Wittgenstein to behaviourism; some that the argument, self-defeatingly, condemns public discourse as well; some that its conclusion is that language is necessarily social in a strong sense, that is, not merely potentially but actually. Much of the secondary (especially the older) literature is devoted to disputes over these matters.

An account of the argument by the influential American philosopher Saul Kripke has spurred a semi-autonomous discussion of it. But Kripke's version involves significant departures from the original and relies on unargued assumptions of a kind Wittgenstein rejected in his own treatment of the topic.

STEWART CANDLISH

PRIVATE STATES AND LANGUAGE

Something is 'private' if it can be known to one person only. Many have held that perceptions and bodily sensations are in this sense private, being knowable only by the person who experiences them. (You may know, it is often said, that we both call the same things 'green'; but whether they really look the same to me as they do to you, you have no means of telling.) Regarding the relation between private states and language two main questions have arisen:

(1) Could there be a 'private language', that is, a language in which a person communicates to themselves, or records for their own use, information about their own private states – this language being in principle incomprehensible to others, who do not know the nature of the events it is used to record? This question is primarily associated with Ludwig Wittgenstein.
(2) Can the nature of our private states affect the meaning of expressions in the public language, that is, the language we use for communicating with each other? Or must everything that affects the meaning of expressions in the public language be something which is itself public, and knowable in principle by anyone? Michael Dummett has argued that we must accept the second of these alternatives, and that this has far-reaching consequences in logic and metaphysics.

EDWARD CRAIG

PROBABILITY, INTERPRETATIONS OF

Introduction

The term 'probability' and its cognates occur frequently in both everyday and philosophical discourse. Unlike many other concepts, it is unprofitable to view 'probability' as having a unique meaning. Instead, there exist a number of distinct, albeit related, concepts, of which we here mention five: the classical or equiprobable view, the relative frequency view, the subjectivist or personalist view, the propensity view, and the logical probability view. None of these captures all of our legitimate uses of the term 'probability', which range from the clearly subjective, as in our assessment of the likelihood of one football team beating another, through the inferential, as when one set of sentences lends a degree of inductive support to another sentence, to the obviously objective, as in the physical chance of a radioactive atom decaying in the next minute. It is often said that what all these interpretations have in common is that they are all described by the same simple mathematical theory – 'the theory of probability' to be found in most elementary probability textbooks – and it has

traditionally been the task of any interpretation to conform to that theory. But this saying does not hold up under closer examination, and it is better to consider each approach as dealing with a separate subject matter, the structure of which determines the structure of the appropriate calculus.

1 The project

The task of interpreting probability might be approached in three distinct ways. The first way is to see the project as one of providing an explicit definition of the term 'probability' or, more usually, of the predicate 'has a probability of value *p*'. The second is to provide operational content to this predicate; in other words, to provide a set of procedures by means of which various probability values can be measured or attributed. This second task may result only in the provision of sufficient conditions for attributing the predicate, and conversely a solution to the first task may be accomplished without the definition providing us with a way to measure probability values. At one time, when verificationism held sway, a failure to provide measurement criteria was considered fatal to a definition (see LOGICAL POSITIVISM §4; OPERATIONALISM), but we should keep separate these two tasks. The third approach is to provide an implicit definition of the predicate 'has a probability of value *p*' by means of an axiomatized theory of probability, followed by an interpretation or model for that theory. That is, because the concept of probability is often considered to be mysterious and inaccessible to observation in a way that the concept of, say, blue, is not, the best and perhaps the only way of providing content to the concept is by constructing a detailed theory of probability and providing a model within which the theory is true. This third project consists in putting structural constraints on possible interpretations of a probability function, and it will not ordinarily result in an explicit definition. It will also not usually assign specific values to outcomes, except for certain extremal values, such as the certain or the impossible event.

2 The formal theory

The structure of elementary probability theory is often motivated by an appeal to familiar facts about relative frequencies. Suppose that a chance process, such as rolling a die, has *N* possible outcomes which form an outcome space $\Omega = \{1, 2, 3, 4, 5, 6\}$. By taking subsets of Ω, such as $\{2, 4, 6\}$, we have an event consisting in the die coming up even. Then take all possible subsets of Ω and this will form an algebra A of subsets of Ω, for example, a set of subsets of Ω closed under complementation ('negation') and union ('disjunction'). Let us say that an event E in A occurs if the elementary outcome, such as '2', is in E. Then we can define a probability function P over A by letting $\mathrm{P}(E) =$ the number of times E occurs/the total number of repetitions of the chance process. This immediately gives us that

(1) $\mathrm{P}(\Omega) = 1$

(2) $\mathrm{P}(E) \geq 0$

(3) If two events E and F are mutually exclusive, then $\mathrm{P}(E \cup F) = \mathrm{P}(E) + \mathrm{P}(F)$.

For mathematical convenience, this elementary theory is usually extended by requiring countable additivity, wherein (3) is replaced by

(3′) $\mathrm{P}(\cup_{i=1}^{\infty} E_i) = \sum_{i=1}^{\infty} \mathrm{P}(E_i)$ when the E_i are all mutually disjoint.

(The structure of A then needs to be more complex in ways that are inessential here.)

An important definition to add is that of conditional probability, $\mathrm{P}(A \mid B)$, the probability of *A* given *B*, defined as $\mathrm{P}(A \mid B) = \mathrm{P}(A \cap B)/\mathrm{P}(B)$. Two elements of A are *independent* if and only if $\mathrm{P}(A \mid B) = \mathrm{P}(A)$ or, equivalently, if $\mathrm{P}(A \cap B)\mathrm{P}(A) \times \mathrm{P}(B)$.

This abstract calculus is now no longer tied to the particular interpretation with which we began, and the algebra can be one of propositions rather than events, an ontology preferable for logical or subjective interpretations. Different accounts of probability can now be compared to this axiomatic theory.

3 Relative frequency theories

Here the ontology is one of event types, and the probability is explicitly defined either as the actual finite relative frequency as in §2 above, or as the limit value of the relative frequency when the total number of repetitions goes to infinity. This gives the value of the probability as an empirical property of the sequence or reference class of outcomes which generates the frequency, rather than absolutely. A naïve finite frequency interpretation is clearly unsatisfactory. Suppose a die is rolled a finite number of times *N*. Then no outcome, say a '6', can have a probability value more fine-grained than on a scale 0, 1/*N*, 2/*N*, . . . , 1. Thus, after two

throws, a '6' could only have a probability of 0, 0.5, or 1. This problem could be circumvented by requiring sufficiently many repetitions, where 'sufficiently many' would be a function of the number of possible outcomes and degree of precision required. A more standard remedy for this problem is to move to a limiting relative frequency interpretation, wherein the probability value is simply defined as the limit of m/N as $N \to \infty$, where m is the number of successes. This solves our first, definitional, task, but it produces a difficulty for the measurement project, for there is no guarantee that the value of the relative frequency after, say, 1,000 repetitions, will be the same as, or close to, the limiting value, because an unusual run of outcomes could occur initially. What one can do is appeal to the strong law of large numbers for binary valued outcomes, which asserts that if the repetitions of the experiment are independent and identically distributed (that is, the probability does not vary from repetition to repetition) then

for every $\varepsilon > 0$, with probability one $|m/N - p| > \varepsilon$ only finitely often.

This provides assurance that in the long run, the probability that the limiting frequency will differ from the 'true' value of p is zero, but at the cost of introducing a second order probability which in turn needs to be interpreted. As an additional requirement, Richard von Mises correctly insisted that limiting frequency values can only be drawn from random sequences of data. Thus, if our die gave us the sequence of outcomes 1, 2, 3, 4, 5, 6, 1, 2, 3, 4, 5, 6, ..., the limiting frequency of a '2' would be 1/6, but quite clearly on every $(6N + 2)$nd throw ($N = 0,1,2, \ldots$) the probability of '2' would be 1, and would be 0 on any other throw. This highlights what is known as the problem of single-case probabilities – how do we transfer a probability value from a class to a single outcome? A standard answer is that the appropriate frequency for an outcome type is one drawn from a random sequence. Attempts to solve this single-case problem have led to complex and fascinating theories of randomness and statistical relevance, each of which is of philosophical interest in its own right.

4 Propensity theories

We have seen above that relative frequencies are defined relative to a class of outcomes. If we focus on the fact that outcomes can be produced by a fixed set of generating conditions, then it is reasonable to attribute probabilities to a system in a physical context, especially when the system producing the outcomes is irreducibly indeterministic. This gives us a chance disposition or *propensity* to produce a given outcome. For example, the probability of decay within the next minute is a physical property of a radioactive atom, just as is its atomic weight. This view, which seems to have originated with C.S. Peirce, and was resurrected by KARL POPPER (§3), has been criticized as excessively metaphysical. This is an unfair criticism, for the propensity value can be measured empirically for a system with a fixed propensity by employing the strong law of large numbers, mentioned above, together with statistical estimation techniques, thus satisfying the operational criterion. Being a thoroughly ontological interpretation, propensity accounts do not provide an explicit reductionist definition of probability, for propensities are basic, often primitive, properties of the world. However, no satisfactory solution has yet been given for the third project of providing a propensity calculus. Nor, despite a number of efforts by Popper and others, has a satisfactory argument been provided that quantum probabilities are obviously propensities in any detailed sense (see CAUSATION; QUANTUM MECHANICS, INTERPRETATION OF; STATISTICS).

5 Subjective probabilities

In contrast to the objective interpretations just described, probability has always had a close relation with degrees of rational belief. Within this tradition, one can measure such degrees of belief operationally by means of betting behaviour. Here the elements to which the probabilities attribute values are propositions or sentences rather than events. By means of an ingenious operational process, known as the Dutch book method, within which the probability value is defined in terms of the lowest odds at which the gambler will accept a bet, one can show that plausible constraints on rational behaviour are satisfied if and only if axioms (1)–(3) and the definition of conditional probability of §2 hold. The subjective probability assignments are then said to be coherent. Thus we have satisfied the second and third criteria cited earlier, although it should be noted that different individuals can assign widely different values to a contingent proposition and both be coherent. De Finetti, however, held that (3′) was not true for subjective probabilities because placing an infinite number of bets makes no sense for human agents. The Dutch book method will give us what are called prior probabilities but, except for extremal values, these are not arrived at by an a priori process. Rather, they are the expression of an unarticulated amalgamation of background knowledge. Although there is some controversy over how best to revise beliefs in the light of empirical evidence, the traditional way to

do this is via conditionalization, using Bayes' theorem. If H_j is a hypothesis (say that the die is fair), E is empirical evidence (say data from throws) and P_0 is our prior subjective probability assignment, then

$$\begin{aligned} P_1(H_j) &= P_0(H_j \mid E) \\ &= P_0(E \mid H_j)P_0(H_j) / \sum_i P_0(E \mid H_i)P_0(H_i) \end{aligned}$$

where $\{H_i\}$ is the set of hypotheses under consideration and P_1 is the new, posterior, probability assignment. Provided that the members of $\{H_i\}$ are distinct hypotheses (only one can be true at any time) and that $\sum_i P_0(H_i) = 1$ (the possibility that no member of $\{H_i\}$ is true is not entertained), $\sum_i P_0(E \mid H_i)P_0(H_i) = P_0(E)$, which gives $P_1(H_j) = P_0(H_j \mid E)P_0(H_j)/P_0(E)$.

The above gives us a normative theory of how agents should distribute their degrees of belief, but there has always been a divergence between this normative Bayesianism and individuals' actual degrees of belief. Investigations by psychologists and economists have revealed systematic differences from Bayesian prescriptions, even by agents well versed in probabilistic reasoning.

6 Classical interpretations of probability

This approach allocates probability values by dividing the outcomes into equipossible cases, and then using a principle of indifference to give each equipossible case an equal probability. Thus, if one considers, on the basis of symmetry, that each side of a die is just as likely to come up as any other side, then the classical theory attributes a value of 1:6 to each such outcome. This is not, contrary to many claims, always an a priori attribution, because it generally depends upon some specific empirical knowledge about symmetries of the system. The classical approach is unsatisfactory for a variety of reasons. First, it is limited to situations in which equipossible cases are available. Second, there are straightforward paradoxes associated with this approach, which allow different probability values to be attached to the same event. The simplest is one introduced by Bertrand. Suppose you have wine and water mixed, in a ratio somewhere between one part of water to one of wine, and two parts water to one of wine. Using an indifference principle on the ratio water:wine, we have that the probability of the ratio lying between 1 and 1.5 is 1:2. Now consider the ratio wine:water. This can lie between 1:2 and 1, and the water:wine ratio of 1:5 is a wine:water ratio of 2:3. The indifference principle then says that the probability of this ratio lying between 1 and 2:3 has a probability of 2:3. This is contradictory.

7 Logical interpretations and other approaches

The logical approach takes propositions as the objects to which probabilities are ascribed, and interprets a conditional probability as a logical relation giving a degree of inductive support from the conditioning sentence to the conditioned. Thus, $P(H \mid E)$ is the degree of inductive support that the evidence statement E gives to the hypothesis H. To measure $P(H \mid E)$, Carnap considered state descriptions. In the simplest case, one lists all the individuals $a_1 \ldots a_n$ in a world and all the predicates $F_1 \ldots F_r$. Then a state description is an attribution of F_i or $\sim F_i$ to each individual a_j for all i and j, that is, a maximally consistent description of some possible world. If we now attribute, in an a priori way, a measure m on state descriptions (and this can be done in a number of ways), then the conditional logical probability is just $m(H \& E)/m(E)$. The principal drawback to using state descriptions is that learning from experience is impossible, simply because all predicates are logically independent and hence observing an instance of the property it represents gives no information about instances of any other. For this reason, Carnap switched to structure descriptions, within which individuals are indistinguishable. Interestingly, the differences between Maxwell–Boltzmann statistics, Bose–Einstein, and Fermi–Dirac statistics in physics are representable as differences that depend upon which states are physically possible. Because it is an empirical fact which particles satisfy which statistics, this sheds considerable doubt upon the whole enterprise of making a priori probability attributions.

There are now well-entrenched theories of comparative probability within which numerical values are not assigned, but one outcome is simply considered to be at least as probable as another. Alternatively, rather than assigning specific values to a proposition, intervals of probability can be assigned to mirror our uncertainty about the correct value via upper and lower probabilities. The connections between subjective probability and objective chance are now also the subject of much interest.

PROBLEM OF EVIL

See EVIL, PROBLEM OF

PROCESS PHILOSOPHY

In the broad sense, the term 'process philosophy' refers to all worldviews holding that process or becoming is more fundamental than unchanging being. For example, an anthology titled *Philosophers of Process* (1965) includes selections from Samuel Alexander, Henri Bergson, John Dewey, William James, Lloyd Morgan, Charles Peirce and Alfred North Whitehead, with an introduction by Charles HARTSHORNE. Some lists include Hegel and Heraclitus. The term has widely come to refer in particular, however, to the movement inaugurated by Whitehead and extended by Hartshorne. Here, process philosophy is treated in this narrower sense.

Philosophy's central task, process philosophers hold, is to develop a metaphysical cosmology that is self-consistent and adequate to all experienced facts. To be adequate, it cannot be based solely on the natural sciences, but must give equal weight to aesthetic, ethical and religious intuitions. Philosophy's chief importance, in fact, derives from its integration of science and religion into a rational scheme of thought. This integration is impossible, however, unless exaggerations on both sides are overcome. On the side of science, the main exaggerations involve 'scientific materialism' and the 'sensationalist' doctrine of perception. On the side of religion, the chief exaggeration has been the idea of divine omnipotence. Process philosophy replaces these ideas with a 'panexperientialist' ontology, a doctrine of perception in which nonsensory 'prehension' is fundamental, and a doctrine of divine power as persuasive rather than coercive.

DAVID RAY GRIFFIN

PROCESS THEISM

Process theism is a twentieth-century school of theological thought that offers a nonclassical understanding of the relationship between God and the world. Classical Christian theists maintain that God created the world out of nothing and that God not only can, but does, unilaterally intervene in earthly affairs. Process theists, in contrast, maintain that God and the basic material out of which the rest of reality is composed are coeternal. Moreover, process theists believe that all actual entities always possess some degree of self-determination. God, it is held, does present to every actual entity at every moment the best available course of action. And each entity does feel some compulsion to act in accordance with this divine lure. But process theists deny that God possesses the capacity to control unilaterally the activity of any entity. Thus, what occurs in relation to every aspect of reality involving a multiplicity of entities – for example, what happens in relation to every earthly state of affairs – is always a cooperative effort.

This understanding of the God–world relationship has significant theological implications. For instance, while classical Christians must attempt to explain why God does not unilaterally intervene more frequently to prevent horrific evils, process theists face no such challenge since the God of process thought cannot unilaterally control any earthly state of affairs. On the other hand, while most classical Christians maintain that God at times unilaterally intervenes in our world primarily because divine assistance has been requested, process theists naturally deny that God can be petitioned efficaciously in this sense since they believe that God is already influencing all aspects of reality to the greatest possible extent. Moreover, while most Christian theists believe that God will at some point in time unilaterally bring our current form of existence to an end, process theists maintain that the same co-creative process now in place will continue indefinitely.

Not everyone finds the process characterization of the God–world relationship convincing or appealing. But few deny that process theism has become a significant force in modern American theology.

DAVID BASINGER

PROCESSES

A process is a course of change with a direction and internal order, where one stage leads on to the next. Processes can be physical (such as atomic decay), biological (such as the growth of living things), artificial (such as building a house) and social (such

as carrying out a criminal investigation). Much of what is said about processes can be said about sequences of events. The concept of event, however, suggests a separate occurrence, whereas that of a process suggests something which is ongoing. There are matters, such as development in organisms, where to see what is happening as part of a process has an advantage over thinking of it as an event. Causes are generally spoken of as events, but the more dynamic concept of causal processes may get nearer to expressing the transition between cause and effect. Moreover, to explain something as a stage in a process can take account not only of what has happened in the past, but of what might happen in the future. This may (but need not) involve purpose; with organisms it involves development through functionally interrelated activities. In some social processes there can be a practical, moral significance in seeing a situation as a stage in a process, since this can encourage us to look to a further stage where something constructive might be brought out of what could otherwise be seen as simply an untoward event or an unhappy situation.

DOROTHY EMMET

PROFESSIONAL ETHICS

Professional ethics is concerned with the values appropriate to certain kinds of occupational activity, such as medicine and law, which have been defined traditionally in terms of a body of knowledge and an ideal of service to the community; and in which individual professionals have a high degree of autonomy in their practice. The class of occupations aiming to achieve recognition as professions has increased to include, for example, nursing, while at the same time social and political developments have led to criticism of and challenge to the concepts of professions and professionalism. Problems in professional ethics include both regulation of the professional–client relationship and the role and status of professions in society. A central question for ethics is whether there are values or virtues specific to particular professions or whether the standards of ordinary morality are applicable.

PROJECTIVISM

'Projectivism' is used of philosophies that agree with Hume that 'the mind has a great propensity to spread itself on the world', that what is in fact an aspect of our own experience or of our own mental organization is treated as a feature of the objective order of things. Such philosophies distinguish between nature as it really is, and nature as we experience it as being. The way we experience it as being is thought of as partly a reflection or projection of our own natures. The projectivist might take as a motto the saying that beauty lies in the eye of the beholder, and seeks to develop the idea and explore its implications.

The theme is a constant in the arguments of the Greek sceptics, and becomes almost orthodox in the modern era. In Hume it is not only beauty that lies in the eye (or mind) of the beholder, but also virtue, and causation. In Kant the entire spatio-temporal order is not read from nature, but read into it as a reflection of the organization of our minds. In the twentieth century it has been especially non-cognitive and expressivist theories of ethics that have adopted the metaphor, it being fairly easy to see how we might externalize or project various sentiments and attitudes onto their objects. But causation, probability, necessity, the stances we take towards each other as persons, even the temporal order of events and the simplicity of scientific theory have also been candidates for projective treatment.

PROLĒPSIS

In post-Aristotelian Greek philosophy, the term *prolēpsis* (plural *prolēpseis*) was used, first by Epicurus and then by the Stoics, to refer to basic general concepts. These concepts were held to be preconditions of rational thought and language. For the most part, the Epicureans and Stoics thought that *prolēpseis* were formed by experience.

DOMINIC SCOTT

PROMISING

Promising is often seen as a social practice with specific rules, determining when a promise has been made and requiring that duly made promises be kept. Accordingly, many philosophers have sought to explain the obligation to keep a promise by appealing to a duty to abide by such rules, whether because of the social benefits of the practice or because fairness requires one to abide by it. Others

see breaking a promise as a direct wrong to the person whose expectations are disappointed.

PROOF THEORY

Proof theory is a branch of mathematical logic founded by David Hilbert around 1920 to pursue Hilbert's programme. The problems addressed by the programme had already been formulated, in some sense, at the turn of the century, for example, in Hilbert's famous address to the First International Congress of Mathematicians in Paris. They were closely connected to the set-theoretic foundations for analysis investigated by Cantor and Dedekind – in particular, to difficulties with the unrestricted notion of system or set; they were also related to the philosophical conflict with Kronecker on the very nature of mathematics. At that time, the central issue for Hilbert was the 'consistency of sets' in Cantor's sense. Hilbert suggested that the existence of consistent sets, for example, the set of real numbers, could be secured by proving the consistency of a suitable, characterizing axiom system, but indicated only vaguely how to give such proofs model-theoretically. Four years later, Hilbert departed radically from these indications and proposed a novel way of attacking the consistency problem for theories. This approach required, first of all, a strict formalization of mathematics together with logic; then, the syntactic configurations of the joint formalism would be considered as mathematical objects; finally, mathematical arguments would be used to show that contradictory formulas cannot be derived by the logical rules.

This two-pronged approach of developing substantial parts of mathematics in formal theories (set theory, second-order arithmetic, finite type theory and still others) and of proving their consistency (or the consistency of significant sub-theories) was sharpened in lectures beginning in 1917 and then pursued systematically in the 1920s by Hilbert and a group of collaborators including Paul Bernays, Wilhelm Ackermann and John von Neumann. In particular, the formalizability of analysis in a second-order theory was verified by Hilbert in those very early lectures. So it was possible to focus on the second prong, namely to establish the consistency of 'arithmetic' (second-order number theory and set theory) by elementary mathematical, 'finitist' means. This part of the task proved to be much more recalcitrant than expected, and only limited results were obtained. That the limitation was inevitable was explained in 1931 by Gödel's theorems; indeed, they refuted the attempt to establish consistency on a finitist basis – as soon as it was realized that finitist considerations could be carried out in a small fragment of first-order arithmetic. This led to the formulation of a general reductive programme.

Gentzen and Gödel made the first contributions to this programme by establishing the consistency of classical first-order arithmetic – Peano arithmetic – relative to intuitionistic arithmetic – Heyting arithmetic. In 1936 Gentzen proved the consistency of Peano arithmetic relative to a quantifier-free theory of arithmetic that included transfinite recursion up to the first epsilon number, ε_0; in his 1941 Yale lectures, Gödel proved the consistency of the same theory relative to a theory of computable functionals of finite type. These two fundamental theorems turned out to be most important for subsequent proof-theoretic work. Currently it is known how to analyse, in Gentzen's style, strong subsystems of second-order arithmetic and set theory. The first prong of proof-theoretic investigations, the actual formal development of parts of mathematics, has also been pursued – with a surprising result: the bulk of classical analysis can be developed in theories that are conservative over (fragments of) first-order arithmetic.

WILFRIED SIEG

PROPER NAMES

Introduction

The Roman general Julius Caesar was assassinated on 14 March 44 BC by conspirators led by Brutus and Cassius. It is a remarkable fact that, in so informing or reminding the reader, the proper names 'Julius Caesar', 'Brutus' and 'Cassius' are used to refer to three people each of whom has been dead for about two thousand years. Our eyes could not be used to see any of them, nor our voices to talk to them, yet we can refer to them with our words.

The central philosophical issue about proper names is how this sort of thing is possible: what exactly is the mechanism by which the user of a name succeeds in referring with the name to its bearer? As the example indicates, whatever the mechanism is, it must be something that can relate the use of a name to its bearer even after the bearer has ceased to exist.

In modern philosophy of language there are two main views about the nature of the mechanism. On one account, which originated with Frege, a use of a name expresses a conception or way of thinking of an object, and the name refers to whatever object fits, or best fits, that conception or way of thinking. Thus with 'Cassius', for example, I may associate the conception 'the conspirator whom Caesar suspected because of his size' (recalling a famous speech in Shakespeare's *Julius Caesar*). Conception theories are usually called 'sense' theories, after Frege's term '*Sinn*'. The other account is the 'historical chain' theory, due to Kripke and Geach. In Geach's words, 'for the use of a word as a proper name there must in the first instance be someone acquainted with the object named.... But...the use of a given name for a given object...can be handed on from one generation to another...Plato knew Socrates, and Aristotle knew Plato, and Theophrastus knew Aristotle, and so on in apostolic succession down to our own times. That is why we can legitimately use "Socrates" as a name the way we do' (1969–70: 288–9).

1 Sense theories: introduction

The idea that names express reference-determining conceptions or 'senses' originated with Frege. But Frege was led to it not by wondering about the mechanism of reference, but rather about the difference in 'cognitive value' between two true identity statements of the respective forms $a = a$ and $a = b$ (for example, 'Clark Kent is Clark Kent' and 'Clark Kent is Superman'). Statements of the former sort, he says, are a priori, while the latter 'often contain very valuable extensions of our knowledge and cannot always be established a priori' ('Über Sinn und Bedeuntung' 1892). Frege takes this to show that the propositions expressed by $a = a$ and $a = b$ cannot be the same even when a and b are names of the same person. Yet if the names do corefer, there is no difference in the references of the constituents of $a = a$ and $a = b$; moreover, these two sentences are assembled in the same way. So either they cannot express different propositions, or else – and this is the inference Frege drew – what determines the proposition a sentence S expresses cannot just have to do with the structure of S and the *references* of its constituent words and phrases (see Frege, G. §§3–4; Sense and reference).

Frege's proposal was that in addition to possessing a reference, any meaningful expression has a sense, the sense being a 'way of thinking' of the reference. The proposition a sentence expresses is determined by the senses of the words in it, not their references. Thus 'Clark Kent is Clark Kent' and 'Clark Kent is Superman' express different propositions because 'Clark Kent' and 'Superman' express different senses, senses which happen to be ways of thinking of the same reference. Taking the Superman fiction to be fact, the sense of 'Clark Kent' might be 'the mild-mannered reporter on *The Daily Planet* who has a crush on Lois Lane' while the sense of 'Superman' might be 'the blue-suited extraterrestrial who flies'. Here we specify different conceptions of the same individual in two definite descriptions (expressions of the form 'the so-and-so' – see Descriptions). The proposition that Superman is Clark Kent therefore has the content that the blue-suited extraterrestrial who flies is the mild-mannered reporter on *The Daily Planet* who has a crush on Lois Lane, which may indeed be, in Frege's phrase, an extension of our knowledge.

It was Frege's view that in an ideal language each name would have a fixed sense and reference for everyone; in an ordinary natural language, there are names that fail to refer, and users may fail to agree on the sense of a name for a specific individual, which Frege thought of as deficiencies of natural language. In a modification of Frege's views, Searle allowed that a name may be associated with a whole range of descriptions, different users using different ranges; the bearer of the name need not satisfy all the conditions mentioned in the descriptions, only 'a sufficient number', an intentionally vague condition.

Sense theories along such lines as these have been called 'famous deeds' sense theories. Famous deeds sense theories appear to have been conclusively refuted by Kripke (1972). Kripke objects to such sense theories both as they respond to Frege's own puzzle about the difference between $a = a$ and $a = b$, and as they address our initial question about the mechanism of reference. Let us consider these two issues in turn.

2 Sense theories: do names express senses?

According to Kripke, the propositions one expresses using names do not involve senses or ways of thinking expressed by the names, otherwise some such propositions would be both metaphysically necessary and a priori, which they are clearly not. For example, suppose the sense of 'Aristotle' is 'the

pupil of Plato who tutored Alexander'. Then the sentence

(1) Aristotle was a pupil of Plato

would express the proposition with the content

(2) The pupil of Plato who tutored Alexander was a pupil of Plato.

But (2) is, in a certain sense, necessary, while (1) is not. There is no way things could have gone in which (a) a unique pupil of Plato who tutored Alexander exists and (b) that person was not a pupil of Plato. On the other hand, there are many ways things could have gone in which (a′) Aristotle exists but (b′) Aristotle was not a pupil of Plato (for example, he died young). In other words, granted that there is such a person as Aristotle, he may be a pupil of Plato or he may not be. But granted that there is such a person as the pupil of Plato who tutored Alexander, it follows that he is a pupil of Plato.

This example brings out Kripke's famous distinction between 'rigid' and 'non-rigid' designators. In thinking about or describing other ways things could have gone (other possible worlds) we use a proper name such as 'Aristotle' consistently to denote the same person; this makes proper names rigid designators. But we use definite descriptions such as 'the pupil of Plato who tutored Alexander' differently. With respect to the actual world, this description picks out Aristotle; with respect to a possible world where someone else is the one and only pupil of Plato who tutored Alexander, the description picks out that other person, not Aristotle; and with respect to a possible world where either Plato or Alexander does not exist, the description fails to pick out anyone, even if Aristotle does exist. Hence such descriptions are non-rigid designators. Certain descriptions, such as 'the positive square root of 9', are as rigid as proper names, but this is on account of their subject matter, not their semantic role. It is because the typical famous deeds description is non-rigid that the contrast between pairs such as (1) and (2) *vis-à-vis* necessity and contingency arises (see Reference).

Just as (1) and (2) differ in modal status, they differ epistemically: bracketing the question of existence, (2) is, in a limited sense, knowable a priori, while (1) is not. That is, granted that there was such a person as Aristotle, it is a further, empirical question whether he was a pupil of Plato (there may be a controversy among historians about this). But granted that there was such a person as the pupil of Plato who tutored Alexander, it is not a further question, *a fortiori* not an empirical one, whether he was a pupil of Plato.

The same objections arise to Searle's modified version of the sense theory. For example, no matter what range of descriptions we associate with a name, they will generate statements that are a priori in the manner of (2). If being φ logically implies being φ', then

(3) The thing which is F-and-G or G-and-H is F' or G' or H'

is essentially the same as (2), just more complicated. But if the predicates F, G and H encapsulate famous deeds, the corresponding

(4) *NN* is F' or G' or H',

where '*NN*' is the name with which 'the thing which is F or G or H' is associated, will be no more a priori than (1).

3 Sense theories: do senses determine reference?

Kripke demonstrates another flaw in famous deeds sense theories, namely, that they do not provide an adequate answer to the question about the mechanism of reference. This is because (1) the likely candidate for the sense of a name may pick out an object which is not in fact the name's bearer, or may fail to pick out anything, and (2) we can succeed in referring with a name even when we do not have a 'famous deeds' description associated with it.

Kripke illustrates (1) with two examples. If any description is associated with the name 'Gödel' it is 'the discoverer of the incompleteness of arithmetic'. Does this mean that 'Gödel' refers to that person? What if the theorem was actually proved by Schmidt, who died in strange circumstances, and Gödel got hold of Schmidt's work and represented it as his own? The very fact that we can understand this 'what if' shows that the reference of 'Gödel' is not fixed as whoever discovered the incompleteness of arithmetic. And though this example is fictional, there are similar actual cases: Peano's Axioms are not due to Peano; and Einstein was not the inventor of the atomic bomb. For a case where there are descriptions that do not pick out any object although the relevant name still refers, Kripke gives the example of the prophet Jonah, who really existed (according to the scholarly consensus), but whose career as described in the Bible is essentially fictitious. Again, the mere intelligibility of the claim 'Jonah was a historical person but everything uniquely identifying that the Bible says about him is fictitious' is enough to show that the reference of 'Jonah' is not fixed as the Hebrew prophet who was swallowed by a whale, or by any other condition, no matter how complicated or disjunctive, derived from the Book of Jonah.

As for (2), successful reference without associated (definite) descriptions, Kripke points out that most

people can use the names 'Richard Feynman' and 'Murray Gell-Mann' to refer to those two people, but that, at best, all the typical person knows about either is that he is a famous physicist who won a Nobel Prize (this was before Feynman achieved popular fame for his role in the *Challenger* disaster inquiry). So we have difference in reference with no difference in associated descriptions; therefore associated descriptions are not at the heart of how proper name reference works.

Perhaps these examples only establish such a conclusion for descriptions that encapsulate famous deeds. Kripke considers some other approaches and concludes that they violate an important non-circularity condition: that candidate descriptions must not themselves embed the notion of reference in a way that cannot eventually be eliminated. For example, we might suggest that the reference of 'Socrates' is fixed as 'the man called "Socrates"'. Since 'called' just means 'referred to as', we do not explain how reference to Socrates is possible in this way: what we want to know is how Socrates *gets to be* the man referred to as 'Socrates'. So this goes nowhere as a proposal about the mechanism of reference, and Kripke plausibly argues that the same would be true for more complicated versions of the idea, for example, that 'Gödel' refers to the person to whom the proof of the incompleteness of arithmetic is commonly attributed. So these attempts at a non-famous-deeds description theory fail. However, in view of Kripke's critique of the famous deeds approach, it seems that if any sense theory is to work, it will have to be a non-famous-deeds account of some sort.

4 Historical chains

The main competing account of the mechanism of reference is the Geach–Kripke historical chain account, in which competence to refer with the name is transmitted across generations in the style adverted to in the quotation from Geach above. The historical chain account is sometimes called the 'causal' chain account, since it is held that the links in the chain are forged by transactions of a causal sort. In Kripke's own version, which he says is a 'picture' rather than a theory, a name is introduced into a community by some 'initial baptism' of an object with the name, and then the name is passed on from link to link, it being required at each step that the receiver of the name 'intend . . . to use it with the same reference as the [person] from whom he heard it'.

If we regard being told about, or otherwise hearing about, an object, as a way of becoming 'acquainted' with it, then the Geach–Kripke account instantiates an approach championed by Bertrand RUSSELL, who made acquaintance with an object necessary for referring to it. However, Russell's notion of acquaintance was rather idiosyncratic: apart from my own sense-data, my self, universals and perhaps the present moment, I lack acquaintance with things, according to Russell. Since the ordinary names I use, ostensibly for other people and things, are not names of sense-data, Russell claimed that in a 'logical' sense, ordinary names are not 'proper' names. Rather, he suggested, they are definite descriptions in disguise. For this reason, Kripke sometimes calls the view he opposes the 'Frege–Russell theory of names'. The point to bear in mind is that Frege and Russell had different accounts of how reference works (so there is no 'Frege–Russell theory of reference'), but because on Russell's account ordinary names do not really refer, the two philosophers end up saying similar-sounding things about such names.

Returning to Kripke's account of the mechanism of reference in terms of informational exchanges in which the intention to preserve reference is present, the obvious question is whether it is any improvement on circular description theories. After all, the notion of reference enters explicitly into Kripke's necessary condition for successful passing on of the name, and it also enters at the start of the chain, where some kind of demonstrative reference to the object being baptized is standardly made. To put the same question another way, if this account is explanatory, would there be anything wrong with a description theory which attributed to a name '*NN*' and a user of the name *U* the sense 'the object at the start of the chain of reference-preserving links by which I came into mastery of this name', in which 'I' refers to *U*?

One problem with this version of a description theory is that no ordinary speaker of a natural language associates any such description with a proper name, since the description embodies a philosophical theory, and it is difficult to see how one could justify claiming that the association is 'implicit'. Here there is a contrast with Kripke's proposal, which only requires speakers to have the intention to preserve the reference of the new name they have just learned, and it is surely plausible that speakers do have such an intention. Still, there is some sense in which the fundamental nature of the mechanism of reference is left unexplained. For instance, what exactly is it about an actual baptismal service, or about parents announcing their choice of name, that causes a new 'common currency' name to be added to the language? Or is the request for further explanation here a demand for a 'reductive' account of reference in terms of non-semantic notions (see REFERENCE), something perhaps impossible?

The causal chain picture is not without other difficulties, as Kripke mentions. For instance, straightforward application of the picture could lead to the conclusion that 'Santa Claus' is the name of a certain central European king, which seems wrong. Evans proposed a different causal account on which the 'causal source' of the information associated with the name determines whom it refers to, though in a possibly complex way. Evans observes that the reference of a name in a linguistic community can change over time if it was originally a name for *x* that was mistakenly but consistently misapplied to *y*:*y* would ultimately become the bearer of the name, being the dominant causal source of the information associated with it (unless, as Evans notes, younger members of the community defer in their use of the name towards those for whom it was once a name for *x*). Evans subsequently elaborated upon this account.

5 Direct reference and Frege's puzzle

A striking feature of the Geach–Kripke picture is that it leaves no role for sense to play as that which determines reference. The only candidate for the 'meaning' of a name is therefore the name's reference itself. A theory which claims that the meaning of a name is just its reference, pure and simple, is often called a 'direct reference' theory, 'direct' signifying that reference is not mediated via sense. Such theories trace their origins through Russell back to Mill; more recently, the idea is prominent in the writings of Marcus on reference, and has subsequently been developed and defended in a sustained form by Salmon and Soames.

The main problem which direct reference theories face is the puzzle about the difference between $a = a$ and $a = b$. The general 'failure of substitutivity' puzzle is the puzzle of how it is possible for the meanings of two sentences to differ if the sentences have the same structure and their corresponding parts have the same meaning. For example,

(5) It is self-evident to any rational thinker that if Superman exists, then Superman = Superman

seems true and 'Superman' and 'Clark Kent' have the same reference. Therefore, according to direct reference theory, (5) should have the same meaning as

(6) It is self-evident to any rational thinker that if Superman exists, then Superman = Clark Kent.

But at first sight, (6) does not even have the same truth-value as (5), never mind the same meaning.

Failure of substitutivity is handled straightforwardly on a sense theory of names which allows that coreferential names can have different senses. The claim would be that (not merely the reference but) the sense of 'Superman' enters into the truth-condition of (5), while in (6) the sense of 'Clark Kent' is also involved. There are various mechanisms which might be invoked here, Frege's own being the simplest: in (5) and (6), according to Frege, the proper names refer to their *senses*, rather than to the person they normally refer to (see SENSE AND REFERENCE §5). But the trouble with any explanation of substitutivity failure for proper names that invokes senses is that sense theories of proper names have been so thoroughly battered by Kripke.

Direct reference theory seems to have less to work with to explain the semantic difference between (5) and (6). On perhaps the best known version of the theory, that of Salmon, it is simply denied that there is a semantic difference between (5) and (6). The appearance that substitution changes truth-value in cases such as (5) and (6) is explained as being due to pragmatic effects (see PRAGMATICS). Apparently, the only alternative for a direct reference theorist is to identify some assumption in the argument that substitution of coreferring names ought not to change meaning and deny that assumption. This strategy produces a possible target. We suggested that what makes substitutivity failure puzzling is that sentences with the same structure whose corresponding parts have the same meaning should themselves have the same meaning. But this presupposes that the meaning of the entire sentence is wholly determined by the meaning of its parts and their manner of composition (see COMPOSITIONALITY). However, the notion of structure alluded to in the phrase 'manner of composition' is one which is sensitive only to syntactic categories of expression, not to the identity of expressions. There is another, more 'logical' notion of structure, on which use of a different word, even one with the same meaning, can disrupt structure. In this logical sense, the structure of 'if Superman exists, then Superman = Superman' is 'if *Et* then *tt*', while 'if Superman exists, then Superman = Clark Kent' has the different structure 'if *Et* then $t = t^\star$'. If we hold that substitution is acceptable only when it does not change logical structure, then from (5) we can infer merely

(7) It is self-evident to any rational thinker that if Clark Kent exists, then Clark Kent = Clark Kent

which is presumably true if (5) is. Of course, this does not help with cases of substitutivity failure in

which there is only one occurrence of the name being substituted ('Lois believes that Superman is an extraterrestrial'), but some direct reference theorists have tried to develop a more general notion of structure for these cases.

It is the handling of substitutivity puzzles that is the deciding issue between sense theories and direct reference theories of proper names. Sense theorists need to find a viable account of the senses of names and direct reference theorists need to find a persuasive account either of why substitutivity fails in cases such as (5), or else of why it gives such a convincing appearance of doing so.

PROPERTY

Introduction

Most of the great philosophers have expressed views on property, its justification and limits, and especially on the justification of having private property; generally, one must understand these views against the background of the economic and social conditions of their times. Notable theories include first possession (roughly, 'whoever gets their hands on it justifiably owns it'), labour ('whoever made it deserves to own it'), utility and/or efficiency ('allowing people to own things is the most effective way of running society') and personality ('owning property is necessary for personal development').

Few thinkers now defend the first possession theory but all the other three have their contemporary supporters. Some philosophers combine two or more theories into multi-principled or 'pluralist' justifications of property ownership. Many express concern about wide gaps between rich and poor and argue for constraints on inequalities in property holdings.

1 Concept of property

The concept of property is understood in two main ways. First, it applies to material things such as tools, houses and land. Second, it applies to bundles of 'rights'. Most lawyers and philosophers stress the second understanding over the first. The first is too narrow to accommodate intangibles such as copyrights, patents and trademarks. Moreover, for purposes of legal and philosophical analysis the second understanding is more useful.

Here the word 'rights' covers many normative modalities (see Rights §2). Following Hohfeld and Honoré, the package of rights called 'property' includes: claim rights to possess, use and receive income; powers to transfer, waive and exclude; a disability (a no-power) of others to force a sale; liberty rights to consume or destroy; and immunity from expropriation by the government. It is probably a vain enterprise to try to specify necessary and sufficient conditions for all and only those 'rights' that pertain to property rather than, say, to contract or tort. Yet it is a worthy undertaking to try to identify those 'rights' that seem most central to property or those rules that create such 'rights'.

The second understanding of property finds favour for many reasons. It applies to widely different cultures. It is useful in both legal and philosophical analysis. It can accommodate both 'will' and 'interest' theories of rights. It can capture both full ownership and limited property rights (such as easements), and both tangible and intangible property. It permits distinguishing among different sorts of property depending on the identity of the rightholder. Thus, a single person or a corporation has *private* property, a tribe has *communal* property and a government has *public* or *state* property.

This explanation of the concept of property is neutral with respect to which kinds of things can be the subject of property rights. Few would defend slavery, which is the most extreme form of property in the bodies or persons of others. More disputed are whether people can have property rights in the whole of their own bodies, in bodily parts for use in transplantation, in information, in cultural practices,

in welfare payments or other forms of government largesse, or in seabed resources or objects in outer space.

The approach of Guido Calabresi and Douglas Melamed to the notion of property, which philosopher-economists and lawyer-economists often use, is not conceptually distinct from that of Hohfeld and Honoré. For Calabresi and Melamed the basic idea is an 'entitlement'. An entitlement is, roughly, an interest that the law does or should protect. Decisions must be made as to which entitlements to protect and how to protect them. As to the latter decision, the law may use what Calabresi and Melamed call 'property rules', 'liability rules' and 'rules of inalienability'. These technical terms can be restated in Hohfeld's vocabulary. If a person's entitlement is protected by a property rule, then others have a disability (a no-power) with regard to obtaining the entitlement except at a price agreed to by its holder. If a person's entitlement is protected by a liability rule, then others have a disability with regard to obtaining or reducing the value of the entitlement unless they compensate its holder by an officially determined amount. If a person's entitlement is protected by a rule of inalienability, its holder has no power to transfer the entitlement to others. The real value of Calabresi and Melamed's approach rests in the light that it sheds on the integration of property and tort, on its application to pollution control, on its sensitivity to distributional as well as efficiency considerations, and on the choice between civil and criminal sanctions for violations of property rights.

2 History of theorizing about property

Many of the great philosophers have offered views on property. Plato actually expresses two different views (see PLATO §§14, 17). In the *Republic* he portrays an ideal society in which the rulers and auxiliaries have political power but almost no private property. Ordinary citizens possess private property, with limits on unequal distribution, but have almost no political power. In contrast, the *Laws* depicts a practical, second-best society. It favours individual private possession with underlying communal ownership. Regulations maintain a roughly equal distribution of property.

ARISTOTLE advocates private rather than communal ownership on grounds that relate to the smooth functioning of a society and its economy. His *Politics* fails, however, to show how property should, or can, be 'in a certain sense common, but, as a general rule, private'.

Locke, at least in the *Second Treatise*, offers a labour theory of property (see LOCKE, J. §10). The interpretation of his theory is disputed. It is unclear how much the theory rests on 'mixing' one's labour with unowned things, or on barring the idle from taking the benefit of the labourer's pains, and the extent to which the needs of others and restrictions on spoilage limit the acquisition of property by labour. It is also disputed whether Locke's theory is proto-capitalist or stems from some conception of natural law.

Hume and Bentham are the first important utilitarian theorists of property. For Hume, utility in the sense of common interest explains how private property arises (see HUME, D. §§4–5). It also justifies the general institution of private property and specific rules of property law. BENTHAM understands utility as the balance of pleasure over pain, and views property in terms of expectations. The security of expectations, rather than equality in distribution, is for Bentham the weightier consideration in favour of private property. Nevertheless, Bentham is sharply critical of the English law of property of his day.

Kant and Hegel are also linked, although less closely and in more complicated ways than Hume and Bentham. For Kant, as for Locke, a form of private property can exist in the state of nature (see KANT, I. §10). But Kant has a social contract theory under which only society can give individual possession full normative significance as private property. Hegel regards Kantian private property as excessively individualistic and belonging to the domain of 'abstract right' (see HEGEL, G.W.F. §8). A more sophisticated form of property exists in 'civil society' – roughly, the social correlate of *laissez-faire* capitalism. Only in the 'state' does private property emerge fully transformed; private property, unequally distributed, still exists, but is subject to heavier state regulation in the organic interest of all citizens.

MARX dismisses Hegel's dialectical defence of private property as so much claptrap. Marx believes that capitalist production, not unequal distribution, is the more serious problem, because 'capitalism' distorts human relationships. In particular, private property under capitalism involves 'alienation' – that is, a separation of persons from nature, the products of their labour, other human beings and even themselves (see ALIENATION). *Pace* Marx, it is unclear that all forms of private property must involve alienation, or that alienation will be absent from the mature communist society that he envisages.

3 Systematic justifications of private property

First possession and entitlement. Attempts to justify the acquisition of property by being the first person to possess it have won few converts. The general

difficulty is to show why first possession should support full ownership rather than limited rights of use. Specific difficulties include articulating which acts of possession count, explaining how long they must continue, and identifying the item or area possessed. Suppose that someone claims title to an acre of farmland by standing in one place for an hour. Why should that person not have to farm rather than merely stand, to remain there for a year rather than just an hour, and to perform appropriate acts over the entire acre rather than only on an area two feet square? To many these difficulties have no ready solution. Still, those sympathetic to the rights of aboriginal peoples sometimes invoke first possession.

A related account is the libertarian entitlement theory of Robert Nozick. Nozick's position is hazy on which acts are appropriate acts of acquisition under his principle of justice in acquisition. The literature contains sharp attacks on his position. Among them are objections as to how any individual can, by unilateral action, impose moral duties on others to refrain from using certain resources, worries about inequalities of property holdings, and scepticism that anyone living today has morally valid property rights by transfer from some original acquirer. Nozick has not responded to these attacks. Other libertarian theories are either grounded in economics or based on strong conceptions of freedom and individual rights (see Libertarianism).

Labour. More promising are efforts to recast the labour theory in terms of the desert of the labourer. Lawrence Becker and Stephen Munzer offer somewhat different accounts of a labour–desert principle.

Becker (1977) holds that if a worker adds value to the lives of others in some morally permissible way and without being required to do so, that person deserves a fitting benefit. Property rights may be the most fitting benefit, and which benefit is 'most fitting' depends on purposes. However, Becker's theory leaves it unclear which purposes (for example, an attempt to gain property rights?) and whose purposes (the labourer's or those of other individuals?) are relevant. Also, he does not show why purpose should be the sole test of fittingness. Nevertheless, Becker rightly insists that losses inflicted by the labourer's work require some reduction in property rights or some offsetting compensation or taxation.

Munzer argues that if workers use their bodies to produce something or provide a service, then they have a *prima facie* claim to deserve property rights in the product or in wages. This claim is qualified by scarcity, by the needs and rights of others, and by some post-acquisition changes in situation. Restrictions on transfer may also apply. Moreover, since work is a social activity, a wage policy is in order that makes wages commensurate so far as possible with desert. The heavy qualifications that surround this version of the labour theory support moderate egalitarianism rather than the wide disparities in income and wealth that libertarian theories allow. Critics of Munzer's labour–desert principle have objected that its intellectual underpinnings are not sufficiently clear and that in both theory and practice no precise correlations exist between desert claims and property rights.

Utility and efficiency. Contemporary justifications of this sort owe a distant obligation to Hume and Bentham. These justifications often stress 'efficiency', which does not allow interpersonal comparison of individual preference satisfaction, over 'utility', which does allow them. Because of the invocation of efficiency, the most sophisticated advocates are frequently economists or academic lawyers influenced by economics rather than philosophers.

Utility and efficiency can, given some plausible assumptions about individuals' preferences, justify some public property as well as some rights of private property. They tend (again given certain assumptions about preferences) to justify moderate egalitarianism rather than highly unequal distributions of private property. However, more detailed information is needed to show how utility and efficiency can justify particular rules of property law or radical changes in existing property institutions. Perhaps the most influential theoretical result of applying efficiency to the law of nuisance bears the sobriquet 'Coase's Theorem'. It holds that, under perfect competition and perfect information and with costless transactions, an efficient allocation of resources will result no matter what the decision of the courts concerning liability for damage.

Personality. Contrary to some reports, the personality theory of property did not die with Hegel and the British neo-Hegelians. The basic idea is that people need at least some private property in order to develop healthy character structures. The account of 'property for personhood' by Margaret Radin is probably the best-known and most fully developed contemporary theory of this sort. She applies her theory to many practical legal problems, but some readers find the foundations of her account no clearer than those of Hegel. Her books also suggest that some things are so personal that they ought not to be property or 'commodities' at all.

Pluralist theories. The variety of possible justifications of property has suggested to some writers that the most plausible account of property is 'pluralist' – that is, contains two or more irreducible principles. Becker and Munzer explicitly embrace pluralist

accounts. Other writers do so implicitly. Some critics dismiss such pluralism as eclectic. Other critics contend that if it is impossible to show that the principles never conflict, it is necessary to establish that conflict between principles is logically consistent and otherwise free from objection. Further, it may be harder to apply a pluralist theory rather than a unitary theory to practical problems. Still, those who favour a unitary theory – a theory with a single principle or at least a single supreme principle – must show how it can accommodate the complexity of considered moral judgments concerning property. For anyone who shares Proudhon's worry that property is theft, justification remains the key problem in the theory of property (see PROUDHON, P.-J.).

4 Constraints on the distribution of property

Justice and equality. The liberal tradition in political theory, stemming particularly from Mill, often tries to limit inequalities of property holdings (see MILL, J.S. §§11–12). The limitation can take the form of a side constraint or, in a pluralist theory, of a separate principle of justice and equality. Few philosophers argue for strictly equal holdings. More modest is the 'difference principle' of John RAWLS (§§1–2). Applied to property, this principle would hold that differences in holdings are justifiable only if they are to the greatest benefit of the least advantaged. A related view might concentrate on both the floor and the ceiling: everyone should be ensured a minimum amount of property, and remaining inequalities, if any, should not undermine a fully human life for anyone in society.

Absence of exploitation. The radical tradition in political theory, traceable especially to Marx, stresses the need to eliminate exploitation and other differences in power that derive from unequal property holdings. Roughly, persons are exploited if others secure a benefit by using them as a tool or resource so as to cause them serious harm. Exploitation theory often concentrates as much on problems of economic production as it does on the real or imagined evils of unequal distributions of property. The 'Critical Legal Studies movement', in some of its forms, objects to exploitation and differences in power as they relate to property. More rigorous accounts of exploitation come from the work of John E. Roemer.

PROPOSITIONAL ATTITUDES

Examples of propositional attitudes include the belief that snow is white, the hope that Mt Rosea is twelve miles high, the desire that there should be snow at Christmas, the intention to go to the snow tomorrow, and the fear that one shall be killed in an avalanche. As these examples show, we can distinguish the kind of attitude – belief, desire, intention, fear and so on – from the content of the attitude – that snow is white, that there will be snow at Christmas, to go to the snow, and so forth. The term 'propositional attitudes' comes from Bertrand Russell and derives from the fact that we can think of the content of an attitude as the proposition the attitude is towards. It can be typically captured by a sentence prefixed by 'that', though sometimes at the cost of a certain linguistic awkwardness: it is more natural, for example, to talk of the intention to go to the snow rather than the intention that one go to the snow. The most frequently discussed kinds of propositional attitudes are belief, desire and intention, but there are countless others: hopes, fears, wishes, regrets, and so on.

Some sentences which contain the verbs of propositional attitude – believes, desires, intends, and so on – do not make ascriptions of propositional attitudes. For example: 'Wendy believes me', 'John fears this dog' and 'He intends no harm'. However, while these sentences are not, as they stand, ascriptions of propositional attitudes, it is arguable – though not all philosophers agree – that they can always be analysed as propositional attitude ascriptions. So, for example, Wendy believes me just in case there is some *p* such that Wendy believes that p because I tell her that *p*; John fears this dog just in case there is some *X* such that John fears that this dog will do *X* and so on.

Discussions of propositional attitudes typically focus on belief and desire, and, sometimes, intention, because of the central roles these attitudes play in the explanation of rational behaviour. For example: Mary's visit to the supermarket is explained by her desire to purchase some groceries, and her belief that she can purchase groceries at the supermarket; Bill's flicking the switch is explained by his desire to illuminate the room, and his belief that he can illuminate the room by flicking the switch; and so on. It is plausible – though not uncontroversial – to hold that rational behaviour can always be explained as the outcome of a suitable belief together with a suitable desire.

Some philosophers (examples are Grice and Schiffer) have used the propositional attitudes to explain facts about meaning. They hold that the meanings of sentences somehow derive from the contents of relevantly related beliefs and intentions. Roughly, what I mean by a sentence *S* is captured by the content of, say, the belief that I express by saying *S*.

One fundamental question which divides philosophers turns on the ontological status of the propositional attitudes and of their contents. It is clear that we make heavy use of propositional attitude ascriptions in explaining and interpreting the actions of ourselves and others. But should we think that in producing such ascriptions, we attempt to speak the truth – that is, should we think that propositional attitude ascriptions are truth-apt – or should we see some other purpose, such as dramatic projection, in this usage? Or, even more radically, should we think that there is nothing but error and confusion – exposed by modern science and neurophysiology – in propositional attitude talk?

PROUDHON, PIERRE-JOSEPH (1809–65)

Pierre-Joseph Proudhon was a French social theorist, political activist and journalist. Claiming to be the first person to adopt the label 'anarchist', he developed a vision of a cooperative society conducting its affairs by just exchanges and without political authority. In his lifetime he exercised considerable influence over both militants and theorists of the European left, and he is remembered today as one of the greatest exponents of libertarian socialism. His last writings, though still strongly libertarian, advocated a federal state with minimal functions.

PSYCHĒ

Conventionally translated 'soul', *psychē* is the standard word in classical Greek for the centre of an animal's, and especially a human being's, 'life'. In its earliest usage (in Homer) *psychē* is a breath-like material persisting after death as a mere ghost. Its precise reference to the locus of thought and emotion only began under the influence of philosophy. From the beginning of the fourth century BC it became normal to pair and contrast *psychē* with 'body' (*soma*). The term generated sophisticated discussions. Leading questions include: Is *psychē* immortal? Is it corporeal or incorporeal? What are its parts or functions?

PSYCHOANALYSIS, METHODOLOGICAL ISSUES IN

Philosophers have subjected psychoanalysis to an unusual degree of methodological scrutiny for several interconnected reasons. Even a cursory look at the Freudian corpus reveals a slender base of evidence: eleven 'case histories', including those published jointly with Breuer. On the other hand, the theoretical claims have broad scope: all psychopathology can be traced to repressed sexuality. Further, Freud and his followers have disdained the most widely accepted means of establishing theories – experimental confirmation – while allowing themselves to appeal to such apparently dubious sources of support as dream interpretation, literature and everyday life. Together, these factors conjure a picture of a 'science' with a large gap between theory and evidence that has not and cannot be filled by solid data.

The central methodological question about psychoanalysis is whether there is now or ever has been any evidence supporting its truth. Popper rejected psychoanalysis as a science on the grounds that there could be no possible evidence against it which could test its truth. More recently, Grünbaum has objected that there are serious logical difficulties with appealing to cures as evidence of truth. Grünbaum and others have attacked both the theory of dreams and the use of dream interpretation as evidence. Sulloway and Kitcher have argued that several tenets of psychoanalysis were supported by their nineteenth-century scientific context, particularly certain aspects of Darwinian biology, but that those crucial supports have been eroded by later scientific developments. Eysenck and Wilson have examined experimental results that have been offered in support of various claims of psychoanalysis and rejected them as inadequate to establish any specifically psychoanalytic claims. By contrast, Glymour (and others) have explained how even single case histories could provide evidence in favour of psychoanalysis. Other philosophers have argued that psychoanalysis is continuous with

'common-sense' psychology and is supported by the continual reaffirmation of the essential correctness of common-sense psychological prediction and explanation.

PATRICIA KITCHER

PSYCHOANALYSIS, POST-FREUDIAN

The basic concepts of psychoanalysis are due to Sigmund Freud. After establishing psychoanalysis Freud worked in Vienna until he and other analysts fled the Nazi occupation. Post-Freudian psychoanalysis has evolved in distinct ways in different countries, often in response to influential analysts who settled there.

Freud's patients were mainly adults who suffered from neurotic rather than psychotic disturbances. He found their psychological difficulties to be rooted in conflict between love and hate, caused by very disparate, often fantastic, images deriving from the same parental figure. These images provided the basic representations of the self and others, formed by processes of projection (representing the other via images from the self) and introjection (representing the self via images from the other). The internalized image of a parent could be used to represent the self as related to some version of the other, as in the formation of the punitive super-ego, or as like the other, as in the identification with the parent of the same sex through which the Oedipus complex was dissolved.

Later analysts, including Anna Freud and Melanie Klein, observed that the uninhibited play of children could be seen to express fantasies involving such images, often with striking clarity. This made it possible to analyse children, and to see that their representations of the self were regularly coordinated with fantastic representations of others, with both organized into systematically interacting systems of good and bad. Emotional disturbance was marked by a fantasy world in which the self and idealized good figures engaged in conflict with hateful bad objects, unmitigated by any sense that all derived from the same self and parental figures.

Such observations made it possible to confirm, revise and extend Freud's theories. Klein saw that symptoms, character and personality could be understood in terms of relations to internalized fantasy-figures, laid down in early childhood; and this extended to psychotic disturbances, such as schizophrenia and manic-depressive illness, which turned on the particular nature of the figures involved. This gave rise to the British object-relations approach to psychoanalysis. It also influenced the development of ego-psychology and self-psychology by Hartmann, Kohut and others in the United States, and Lacan's attempt to relate psychoanalysis to language, in France.

PSYCHOLOGY, PHILOSOPHY OF

See Mind, philosophy of

PUFENDORF, SAMUEL (1632–94)

Pufendorf was the first university professor of the law of nature and nations. His *De iure naturae et gentium* (On the Law of Nature and Nations) (1672) and *De officio hominis et civis iuxta legem naturalem* (On the Duty of Man and Citizen according to Natural Law) (1673) greatly influenced the handling of that subject in the eighteenth century. As a result Pufendorf has been recognized as an important figure in the development of the conception of international law as a body of norms commonly agreed to have universal validity by sovereign states. He regarded himself as an exponent of a new moral science founded by Hugo Grotius which transformed the natural law tradition by starting from identifiable traits of human nature rather than ideas about what human beings ought to be.

PUNISHMENT

See Crime and punishment

PURGATORY

According to Roman Catholic teaching, purgatory is the place or state of purification after death in which those who die in a state of grace (and hence are assured of being saved) make expiation for unforgiven venial sins or endure temporal punishment for mortal and venial sins already forgiven. The concept evolved to resolve the theological confusion about the state of souls between personal death and the general resurrection and Last Judgment, to explain what happens to those persons who repent before death but do not live long enough to do penance for their sins, and to make intelligible the widespread practice of praying for the souls of the departed. The doctrine developed in conjunction with a 'high' Eucharistic theology, according to which all the faithful departed take part in the liturgy of the Church. The idea of purgatory

is therefore intimately connected with Christian ideas of sin, judgment, retributive punishment, the communion of saints and the idea that salvation occurs in history. It was rejected by the Reformers and, in the second half of the twentieth century, interest from Catholic theologians waned. Nevertheless, some modern Protestant thinkers have defended the concept as an intermediate phase in salvation.

PUTNAM, HILARY (1926–)
Putnam's work spans a broad spectrum of philosophical interests, yet nonetheless reflects thematic unity in its concern over the question of realism. A critic of logical positivism, Putnam opposed verificationism and conventionalism, arguing for a realist understanding of scientific theories. He rejected the traditional conception of meaning according to which speakers' mental states determine meaning and consequently, reference, and put forward a conception of meaning on which external reality, for example, what one talks about, contributes essentially to meaning. Further, citing what he called the division of linguistic labour, Putnam saw the conferring of meaning as a social rather than an individual enterprise. In response to the relativistic challenge that the incommensurability of different theories precludes any possibility of intertheoretical dialogue, Putnam invoked a causal theory of reference construing reference as relatively insensitive to theoretical variation, so that the continuity and rationality of science and communication are upheld. The Copenhagen interpretation of quantum mechanics posed yet another difficulty for realism. Putnam saw quantum logic as an alternative which was compatible with realism, and argued that logic, like geometry, can be revised on the basis of empirical considerations. In the philosophy of mind, Putnam proposed functionalism, the view that mental states are characterized by function rather than material constitution. Putnam also made a substantial contribution to mathematics through his work on the insolvability of Hilbert's tenth problem.

In 1976, Putnam launched an attack on the coherence of the view he termed 'metaphysical realism'. Arguing that relativism and scepticism are disguised forms of metaphysical realism, and likewise incoherent, he suggested an alternative, referred to as 'internal realism'. Clarification of this position and its viability as a third way between realism and relativism is the focus of Putnam's later writings, and of much of the criticism they have incurred.

YEMIMA BEN-MENAHEM

PYRRHONISM
Pyrrhonism was the name given by the Greeks to one particular brand of scepticism, that identified (albeit tenuously) with Pyrrho of Elis, who was said (by his disciple Timon of Phlius) to have declared that everything was indeterminable and accordingly to have suspended judgment about the reality of things – in particular whether they were really good or bad. After Timon's death Pyrrhonism lapsed, until revived by Aenesidemus. Aenesidemus held that it was inadmissible either to affirm or to deny that anything was really the case, and in particular to hold, with the Academic sceptics, that certain things really were inapprehensible. Instead, the Sceptic (the capital letter denotes the Pyrrhonists, who adopted the term, literally 'inquirer', as one of the designations for their school) should only allow that things were no more the case than not, or only so under certain circumstances and not under others. Aenesidemean Scepticism took the form of emphasizing the disagreement among both lay people and theoreticians as to the nature of things, and the fact that things appear differently under different circumstances (the various ways of doing this were systematized into the Ten Modes of Scepticism); the result was meant to be suspension of judgment about such matters, which would in turn lead to tranquillity of mind. Thus 'Scepticism' denotes a particular philosophical position, not simply, as in modern usage, that of any philosopher inclined towards doubt. Later Pyrrhonists, notably Agrippa, refined the Sceptical method and concentrated on undermining the dogmatic (that is, anti-Sceptical) notion of the criterion – there is no principled way to settle such disputes without resorting to mere assertion, infinite regress or circularity. We owe to Sextus Empiricus our most complete account of Pyrrhonian argument and the clearest exposition of the Pyrrhonian attitude. Faced with endemic dispute, Sceptics reserve judgment; but this does not render life impossible for them, since they will still react to the way things appear to be, although without believing in any strong sense that things really are as they seem. Furthermore, when Pyrrhonians describe their affective states, they do

so undogmatically – and the Sceptical slogans ('I determine nothing', 'nothing is apprehended', and so on) are to be understood in a similar way, as merely reporting a state of mind and not expressing a commitment. Thus the slogans apply to themselves, and like cathartic drugs are themselves purged along with the noxious humour of dogmatism.

R.J. HANKINSON

PYTHAGORAS (*c.*570–*c.*497 BC)

Pythagoras of Samos was an early Greek sage and religious innovator. He taught the kinship of all life and the immortality and transmigration of the soul. Pythagoras founded a religious community of men and women in southern Italy that was also of considerable political influence. His followers, who became known as Pythagoreans, went beyond these essentially religious beliefs of the master to develop philosophical, mathematical, astronomical, and musical theories with which they tended to credit Pythagoras himself. The tradition established by Pythagoras weaves through much of Greek philosophy, leaving its mark particularly on the thought of Empedocles, Plato, and later Platonists.

HERMANN S. SCHIBLI

PYTHAGOREANISM

Pythagoreanism refers to a Greek religious-philosophical movement that originated with Pythagoras in the sixth century BC. Although Pythagoreanism in its historical development embraced a wide range of interests in politics, mysticism, music, mathematics and astronomy, the common denominator remained a general adherence among Pythagoreans to the name of the founder and his religious beliefs. Pythagoras taught the immortality and transmigration of the soul (reincarnation) and recommended a way of life that through ascetic practices, dietary rules and ethical conduct promised to purify the soul and bring it into harmony with the surrounding universe. Thereby the soul would become godlike since Pythagoras believed that the cosmos, in view of its orderly and harmonious workings and structure, was divine. Pythagoreanism thus has from its beginnings a cosmological context that saw further evolution along mathematical lines in the succeeding centuries. Pythagorean philosophers, drawing on musical theories that may go back to Pythagoras, expressed the harmony of the universe in terms of numerical relations and possibly even claimed that things are numbers. Notwithstanding a certain confusion in Pythagorean number philosophy between abstract and concrete, Pythagoreanism represents a valid attempt, outstanding in early Greek philosophy, to explain the world by formal, structural principles. Overall, the combination of religious, philosophical and mathematical speculations that characterizes Pythagoreanism exercised a significant influence on Greek thinkers, notably on Plato and his immediate successors as well as those Platonic philosophers known as Neo-Pythagoreans and Neoplatonists.

Q

QUALIA

The terms 'quale' and 'qualia' (plural) are most commonly understood to mean the qualitative, phenomenal or 'felt' properties of our mental states, such as the throbbing pain of my current headache, or the peculiar blue of the afterimage I am experiencing now. Though it seems undeniable that at least some of our mental states have qualia, their existence raises a number of philosophical problems.

The first problem regards their nature or constitution. Many theorists have noted great differences between our intuitive conceptions of qualia and those of typical physical properties such as mass or length, and have asked whether qualia could nonetheless be identical with physical properties. Another problem regards our knowledge of qualia, in particular, whether our beliefs about them can be taken to be infallible, or at least to have some kind of special authority.

JANET LEVIN

QUANTIFIERS

The quantifiers 'some' and 'every' were the object of the very first logical theory, Aristotelian syllogistic. An example of a syllogism is 'Every Spartan is Greek, every Greek is European, therefore every Spartan is European'. In such inferences, no quantifier is governed by another one. Contrast this with 'Everybody loves somebody'. Modern logic is often taken to have begun when Frege systematized for the first time the logic of quantifiers, including such dependent ones. In general, much of what has passed as logic over the centuries is in effect the study of quantifiers. This is especially clear with the area of logic variously known as quantification theory, lower predicate calculus or elementary logic. Some philosophers have even sought to limit the scope of logic to such a study of quantifiers. Yet the nature of quantifiers is a delicate matter which is captured incompletely by the logic initiated by Frege and Russell.

JAAKKO HINTIKKA
GABRIEL SANDU

QUANTIFIERS, GENERALIZED

Generalized quantifiers are logical tools with a wide range of uses. As the term indicates, they generalize the ordinary universal and existential quantifiers from first-order logic, '$\forall x$' and '$\exists x$', which apply to a formula $A(x)$, binding its free occurrences of x. $\forall x A(x)$ says that $A(x)$ holds for all objects in the universe and $\exists x A(x)$ says that $A(x)$ holds for some objects in the universe, that is, in each case, that a certain condition on $A(x)$ is satisfied. It is natural then to consider other conditions, such as 'for at least five', 'at most ten', 'infinitely many' and 'most'. So a quantifier Q stands for a condition on $A(x)$, or, more precisely, for a property of the set denoted by that formula, such as the property of being non-empty, being infinite, or containing more than half of the elements of the universe. The addition of such quantifiers to a logical language may increase its expressive power.

A further generalization allows Q to apply to more than one formula, so that, for example, $Qx(A(x),B(x))$ states that a relation holds between the sets denoted by $A(x)$ and $B(x)$, say, the relation of having the same number of elements, or of having a non-empty intersection. One also considers quantifiers binding more than one variable in a formula. $Qxy,zu(R(x,y),S(z,u))$ could express, for example, that the relation (denoted by) $R(x,y)$ contains twice as many pairs as $S(z,u)$, or that $R(x,y)$ and $S(z,u)$ are isomorphic graphs.

In general, then, a quantifier (the attribute 'generalized' is often dropped) is syntactically a variable-binding operator, which stands semantically for a relation between relations (on individuals), that is, a second-order relation. Quantifiers are studied in mathematical logic, and have also

been applied in other areas, notably in the semantics of natural languages.

DAG WESTERSTÅHL

QUANTIFIERS, SUBSTITUTIONAL AND OBJECTUAL

Understood substitutionally, 'Something is F' is true provided one of its substitution instances (a sentence of the form 'a is F') is true. This contrasts with the objectual understanding, on which it is true provided 'is F' is true of some object in the domain of the quantifier. Substitutional quantifications have quite different truth-conditions from objectual ones. For instance, 'Something is a mythological animal' is true if understood substitutionally, since the substitution instance 'Pegasus is a mythological animal' is true. But understood objectually, the sentence is not true, since there are no mythological creatures to make up a domain for the quantifier.

Since substitutional quantifiers do not need domains over which they range, it is easy to introduce substitutional quantifiers which bind predicate or sentential variables, even variables within quotation marks. One reason for interest in substitutional quantification is the hope that it may provide a way to understand discourse which appears to be about numbers, properties, propositions and other 'troublesome' sorts of entities as being free of exceptional ontological commitments. Whether natural language quantification is sometimes plausibly construed as substitutional is not, however, clear.

See also: Ontological commitment

QUANTUM LOGIC

The topic of quantum logic was introduced by Birkhoff and von Neumann in 1936, who described the formal properties of a certain algebraic system associated with quantum theory. To avoid begging questions, it is convenient to use the term 'logic' broadly enough to cover any algebraic system with formal characteristics similar to the standard sentential calculus. In that sense it is uncontroversial that there is a logic of experimental questions (for example, 'Is the particle in region R?' or 'Do the particles have opposite spins?') associated with any physical system. Having introduced this logic for quantum theory, we may ask how it differs from the standard sentential calculus, the logic for the experimental questions in classical mechanics. The most notable difference is that the distributive laws fail, being replaced by a weaker law known as orthomodularity.

All this can be discussed without deciding whether quantum logic is a genuine logic, in the sense of a system of deduction. Putnam argued that quantum logic was indeed a genuine logic, because taking it as such solved various problems, notably that of reconciling the wave-like character of a beam of, say, electrons, as it passes through two slits, with the thesis that the electrons in the beam go through one or other of the two slits. If Putnam's argument succeeds this would be a remarkable case of the empirical defeat of logical intuitions. Subsequent discussion, however, seems to have undermined his claim.

PETER FORREST

QUANTUM MEASUREMENT PROBLEM

In classical mechanics a measurement process can be represented, in principle, as an interaction between two systems, a measuring instrument *M* and a measured system *S*, during which the classical states of *M* and *S* evolve dynamically, according to the equations of motion of the theory, in such a way that the 'pointer' or indicator quantity of *M* becomes correlated with the measured quantity of *S*. If a similar representation is attempted in quantum mechanics, it can be shown that, for certain initial quantum states of *M* and *S*, the interaction will result in a quantum state for the combined system in which neither the pointer quantity of *M* nor the measured quantity of *S* has a determinate value. On the orthodox interpretation of the theory, propositions assigning ranges of values to these quantities are neither true nor false. Since we require that the pointer readings of *M* are determinate after a measurement, and presumably also the values of the correlated *S*-quantities measured by *M*, it appears that the orthodox interpretation cannot accommodate the dynamical representation of measurement processes. The problem of how to do so is the quantum measurement problem.

JEFFREY BUB

QUANTUM MECHANICS, INTERPRETATION OF

Quantum mechanics developed in the early part of the twentieth century in response to the discovery that energy is quantized, that is, comes in discrete units. At the microscopic level this leads to odd phenomena: light displays particle-like characteristics and particles such as electrons produce wave-like interference patterns. At the level of ordinary objects such effects are usually not evident, but this

generalization is subject to striking exceptions and puzzling ambiguities.

The fundamental quantum mechanical puzzle is 'superposition of states'. Quantum states can be added together in a manner that recalls the superposition of waves, but the effects of quantum superposition show up only probabilistically in the statistics of many measurements. The details suggest that the world is indefinite in odd ways; for example, that things may not always have well-defined positions or momenta or energies. However, if we accept this conclusion, we have difficulty making sense of such straightforward facts as that measurements have definite results.

Interpretations of quantum mechanics are, in one way or another, attempts to understand the superposition of quantum states. The range of interpretations stretches from the metaphysically daring to the seemingly innocuous. But, so far, no single interpretation has commanded anything like universal agreement.

ALLEN STAIRS

QUINE, WILLARD VAN ORMAN (1908–2000)

Introduction

Quine is the foremost representative of naturalism in the second half of the twentieth century. His naturalism consists of an insistence upon a close connection or alliance between philosophical views and those of the natural sciences. Philosophy so construed is an activity within nature wherein nature examines itself. This contrasts with views which distinguish philosophy from science and place philosophy in a special transcendent position for gaining special knowledge. The methods of science are empirical; so Quine, who operates within a scientific perspective, is an empiricist, but with a difference. Traditional empiricism, as in Locke, Berkeley, Hume and some twentieth-century forms, takes impressions, ideas or sense-data as the basic units of thought. Quine's empiricism, by contrast, takes account of the theoretical as well as the observational facets of science. The unit of empirical significance is not simple impressions (ideas) or even isolated individual observation sentences, but systems of beliefs. The broad theoretical constraints for choice between theories, such as explanatory power, parsimony, precision and so on, are foremost in this empiricism. He is a fallibilist, since he holds that each individual belief in a system is in principle revisable. Quine proposes a new conception of observation sentences, a naturalized account of our knowledge of the external world, including a rejection of a priori knowledge, and he extends the same empiricist and fallibilist account to our knowledge of logic and mathematics.

Quine confines logic to first-order logic and clearly demarcates it from set theory and mathematics. These are all empirical subjects when empiricism is understood in its Quinian form. They are internal to our system of beliefs that make up the natural sciences. The language of first-order logic serves as a canonical notation in which to express our ontological commitments. The slogan 'To be is to be the value of a variable' (*From a Logical Point of View* 1953) encapsulates this project. Deciding which ontology to accept is also carried out within the naturalistic constraints of empirical science – our ontological commitments should be to those objects to which the best scientific theories commit us. On this basis Quine's own commitments are to physical objects and sets. Quine is a physicalist and a Platonist, since the best sciences require physical objects and the mathematics involved in the sciences requires abstract objects, namely, sets.

The theory of reference (which includes notions such as reference, truth and logical truth) is sharply demarcated from the theory of meaning (which includes notions such as meaning, synonymy, the analytic–synthetic distinction and necessity). Quine is the leading critic of notions from the theory of meaning, arguing that attempts to make the distinction between merely linguistic (analytic) truths and more substantive (synthetic) truths has failed. They do not meet the standards of precision which scientific and philosophical theories adhere to and which are adhered to in the theory of reference. He explores the limits of an empirical theory of language and offers a thesis of the indeterminacy of translation as further criticism of the theory of meaning.

1 Life

Willard Van Orman Quine was born on 25 June 1908 and died at the age of 92 on 25 December 2000. He was an undergraduate at Oberlin College and a graduate student at Harvard, where he studied with A.N. Whitehead, C.I. Lewis and Sheffer. In his dissertation 'The Logic of Sequences: A Generalization of *Principia Mathematica*' there already appears a prominent theme of Quine's philosophy – a concern with matters of ontology.

In 1931, Quine had what he has described as his 'most dazzling exposure to greatness', when Bertrand RUSSELL came to lecture at Harvard. Russell is one of the most influential figures on Quine's thought. Both share a preoccupation with questions concerning what there is. For example, Quine adopted and improved upon Russell's view of how we express ontological claims. More significantly, as the dissertation already reveals, Russell's influence was that of a rival whose theories spur Quine on to the creation of more acceptable alternatives. Wherever possible, Quine tries to get on with the fewest and most precise assumptions which will suffice to do the job at hand. Whereas *Principia Mathematica* is constructed on the basis of an ontology that comprises propositional functions, which are properties of a sort, Quine's revision tries to accomplish the same goals with concrete physical objects and sets or classes. In addition, some of Quine's most famous systems of logic and set theory are designed to achieve the same effects as *Principia Mathematica*, while avoiding Russell's theory of types (see THEORY OF TYPES).

A travelling fellowship to Europe in 1932 exposed Quine to the latest developments in logic and in philosophy. In Vienna he attended meetings of the Vienna Circle, and described the following weeks spent in Prague and Warsaw as 'the intellectually most rewarding months I have known' (see VIENNA CIRCLE). In Prague, Quine met Rudolf CARNAP, one of the most careful expositors of prominent themes of analytic philosophy and especially those of the logical empiricists, such as the verifiability criterion for the empirical meaningfulness of sentences, the linguistic (analytic) character of a priori knowledge, as in mathematics and logic, and the triviality or meaninglessness of ontology as a species of metaphysics. Quine subjected each of these themes to severe criticism, resulting in some of the most important philosophical debates of the century. In Warsaw, he attended the lectures of Lesniewski, Łukasiewicz and Tarski and in the next few years was to adopt Tarski's and Gödel's 'classic' formulation of logic in formulating his most famous works. Quine was quite sympathetic to the extensionalist and the nominalist side of the Warsaw school.

At Harvard in the period prior to the Second World War, Quine worked out some of his most distinctive positions: his conception of ontological commitment (best known from his 1948 essay 'On What There Is'); his two most distinctive systems of logic and set theory 'New Foundations for Mathematical Logic' (1937) and *Mathematical Logic* (1940); and his criticisms of the position that a priori knowledge as it purportedly exists in logic and mathematics is merely linguistic. These criticisms began to appear in 1934, when Quine lectured on Carnap's work. Some of this material can be found in 'Truth by Convention' (1936) and his most famous paper, 'Two Dogmas of Empiricism' (1951).

Quine served as a naval officer in the Second World War, and afterwards continued his work on the above topics (see *From a Logical Point of View* (1953)). Much of his most original work since then has been the formulation of a new holistic variety of empiricism and the exploration of its consequences: 'The point of holism, stressed by Pierre Duhem . . . , is that the observable consequence by which we test a scientific hypothesis is ordinarily not a consequence of the hypothesis taken by itself; it is a consequence only of a whole cluster of sentences . . . *Quiddities* (1987: 141). Beginning with 'Two Dogmas', and eventually in *Word and Object* (1960), Quine employed this new holistic empiricism to criticize the concepts of meaning, synonymy and analyticity. In *Word and Object* he presented a thesis of the indeterminacy of translation as a further criticism of these notions. Later, in *Ontological Relativity* (1969), *The Roots of Reference* (1974), *Pursuit of Truth* (1992) and *From Stimulus to Science* (1995) he took a similar critical stance on concepts from the theory of reference. In essays dating from this period Quine's naturalism also comes to the fore. Though the theme of the continuity of philosophy and science is found in earlier works, he explores it more explicitly in 'Epistemology Naturalized' (1969), *Theories and Things* (1981), *Pursuit of Truth* and *From Stimulus to Science*.

2 Epistemology naturalized – nature know thyself

The problem of our knowledge of the external world is traditionally stated as one of how a self with private mental states can come to have knowledge of the external world. Quine's restatement is strikingly more naturalistic:

> I am a physical object sitting in a physical world. Some of the forces of this physical world impinge on my surface. Light rays strike

> my retinas; molecules bombard my eardrums and fingertips. I strike back, emanating concentric air waves. These waves take the form of a torrent of discourse about tables, people, molecules, light rays, retinas, air waves, prime numbers, infinite classes, joy and sorrow, good and evil.
> (*The Ways of Paradox and Other Essays* 1966)

In its traditional statement the problem lies in how, starting with 'experience' in the form of immediately given impressions or sense-data, we justify our claims to know objects such as tables, chairs or molecules. This vantage point was that of a first philosophy, intended as providing a foundation of certainty for the sciences by standing outside of them and legitimizing their accomplishments. Quine rejects this formulation. His naturalized epistemology rephrases the problem as one of how we learn to talk about or refer to objects (ordinary as well as scientific). What are the conditions that lead to reference? How is scientific discourse possible?

The traditional accounts of the linkage between 'experience' and our knowledge vary from mentalistic conceptions, like that of Hume, in which all our ideas are copies of sense impressions, to more neutral linguistic formulations, in which cognitive claims are to be translated into observation sentences. On Quine's holistic account, one cannot deal with the empirical content of sentences, much less of terms – the linguistic correlates of ideas – one by one, either via definition, translation or some other sort of linkage. To study the relation of knowledge and science to observation sentences is to trace the psychological and linguistic development of the knower, that is, the potential user of scientific language. Observation sentences serve as both the starting point in human language learning as well as the empirical grounds for science. The problem of knowledge now is how, starting with observation sentences, we can proceed to talk of tables, chairs, molecules, neutrinos, sets and numbers. One of the reasons for doing epistemology by studying the roots of reference is simply the failure of the traditional empiricists' programme mentioned above. Another is that it enables one to dispense with mentalistic notions such as 'experience' or 'observation'. One relies instead on two components which are already part of a naturalist's ontology: the physical happening at the nerve endings, the neural input or stimulus; and the linguistic entity, the observation sentence. These two serve as naturalistic surrogates for 'experience' and 'observation'. On Quine's empiricist and behaviourist account, observation sentences are those that can be learned independently of other language acquisition. They are the sentences that can be learned purely by ostension and as such are causally most proximate to the stimulus. This account is not vulnerable to attacks on the notion of observation as dependent on the theories one holds, since observation sentences are precisely those which are learnable without any background information. Another point of difference with empiricists concerns the alleged certainty or incorrigibility of observation. Though Quine's observation sentences are assented to with a minimum of background information and are thus included among those sentences less likely to be revised, they are not in principle immune from revision.

Unlike traditional epistemology, then, Quine's epistemology is naturalistic: we cannot stand apart from our place as part of nature and make philosophical judgments (see NATURALIZED EPISTEMOLOGY). This is part of the theme that philosophy is continuous with science, science being the part of nature most suitable for knowing itself.

> The naturalistic philosopher begins his reasoning within the inherited world theory as a going concern. He tentatively believes all of it, but believes also that some unidentified portions are wrong. He tries to improve, clarify and understand the system from within.
> (*Theories and Things* 1981)

There is no cognitive standpoint outside of nature: philosophy, and in particular, epistemology, is no exception. We cannot stand apart from our scientific worldview and make philosophical judgments. As an example consider the problem of induction. It is frequently stated as scepticism about knowing whether the future will resemble the past. If this scepticism is stated as requiring a justification of induction in the sense that we provide a deductive or an inductive argument for the future (in relevant respects) resembling the past, then we should refuse to accede to that request. It is well known that such arguments are either question-begging or require a standpoint beyond our natural cognitive abilities which there is little reason for thinking we can attain to. 'The Humean predicament is the human predicament' (*Ontological Relativity and Other Essays* 1969). Since justification in the above sense is out of the question, what should and what can we do? Quine dealt with this problem by adopting the stance of a scientist examining scientific practice. The psychogenesis of reference consists of hypotheses as to how we get to talk about objects. This involves hypothesizing an innate ability to spot similarities. Induction in its most primitive forms is of a piece with recognizing

similarities. We have a built-in mechanism to expect similarities. However, it does not guarantee that we will find them.

> Perceptual similarity is the basis of all expectations, all learning, all habit formation. . . . This is primitive induction.
>
> Since learning hinges thus on perceptual similarity, perceptual similarity cannot itself have been learned – not all of it. Some of it is innate.
>
> The survival value of primitive induction is anticipation of something edible, or of some creature by which one might be eaten. Thus it is that natural selection has endowed us with standards of perceptual similarity that mesh pretty well with natural trends. The future is as may be, but we persist hopefully.
>
> (*From Stimulus to Science* 1995)

Such is Quine's treatment of Hume's problem of why we believe that similar causes have similar effects. He deals with the problem in the setting of evolutionary psychology where Hume dealt with it in terms of the associationist psychology of his times. Quine, like Hume, is not attempting to justify induction in the sense of providing an argument for something like the uniformity of nature. Parallel to Hume, Quine offers an empirical account – a theory within empiricism of why we believe the future will resemble the past. Both hold that the source of this belief is 'subjective', i.e. found in the human subject. They differ in that Hume holds that the subject acquires this belief as a result of 'experience' and association whereas Quine says its source is a gene-determined disposition to spot similarities, which Quine supplements with an account from evolutionary psychology.

3 Dethroning the a priori

A purported stumbling block for empiricism is a priori knowledge in logic and mathematics and in such purportedly conceptual truths as 'All bachelors are unmarried' and 'Nothing is larger than itself'. Such subject matter appears to defy justification in terms of observation. J.S. Mill's empiricist programme foundered on this point, and the various forms of rationalism are unacceptable to an empiricist. A proposed solution, the dominant one favoured by analytic philosophers, involved the analytic–synthetic distinction: all a priori knowledge was said to be analytic, in the sense that the truth of sentences claimed to be known independent of experience was reducible to matters of language, for example, linguistic convention, definitions, and truth in virtue of the meaning of the expressions involved.

Quine's critique is that of an empiricist reforming empiricism, supplanting reductionist-atomistic empiricism with Duhemian holism. Experimental testing is a juncture where observation ('experience') enters as a factor in deciding whether to accept or reject a claim. An oversimplified model of how observation counts in testing is that given a hypothesis and a statement of initial conditions, we deduce by logic and/or mathematics some observation sentence as an observable consequence. If the expected observation occurs, we take this as evidence for the hypothesis. If it does not, we take this as evidence that the hypothesis is false. Such a model makes use of the dogma of reductionism by assuming that individual sense experiences-observation sentences function unequivocally for or against isolated sentences-hypotheses. Pierre Duhem showed that this model is flawed and Quine extends Duhem's point into a holistic one that embodies a critique of reductionism and the a priori.

Duhem had pointed out that where the observation fails to occur, one has leeway in dealing with the situation. All serious testing involves background assumptions, implicit in the hypothesis or in the statement of the initial conditions. A test situation underdetermines which factor should be revised and there is no way of knowing in advance where the revision should be made. Quine's insight was to take cognizance of all the assumptions that can be questioned in a test situation. The underdetermination of theory by observation does not stop with revising background assumptions relative to the hypothesis and the initial conditions. Both the purportedly disconfirming observation made and the principles involved in deriving the observable consequence can also be revised. In test situations whole systems of beliefs go into the hopper and we have leeway as to how we make the consistency-preserving revisions. We can edit the observation. We can even question the logic and or mathematics used in deriving the observable conclusion. No sentence is in principle immune from being revised. In this spirit, all knowledge is empirical; there is no a priori knowledge. The quest for certainty is replaced by fallibilism, the associated foundationalist programmes are abandoned, as is the verifiability theory of the logical empiricists. Instead, the broad constraints on what to do in a test situation are the natural scientist's criteria for preferring one hypothesis, theory or system of beliefs over another. These criteria include explanatory power, simplicity or parsimony, conservatism, modesty and precision. Conservatism cautions, other things being equal, that we should accept that hypothesis-theory which clashes least with our other beliefs. This 'maxim of minimal

mutilation' comes into play in explaining why logic, while in principle revisable (for example, some suggest adopting a three-valued logic), is the least likely item to be revised. Doing so would have far-reaching consequences for our other beliefs. Modesty says that all other things being equal we should hypothesize as little as is necessary for the job at hand. Precision mandates standards on introducing and explaining philosophical or scientific concepts. It requires that philosophical explications be couched in acceptable terms, the extensional or empirical notions of logic, set theory and the sciences. For example, abstract objects should not be posited without a precise account of what they are, that is to say, 'no entity without identity' (see A PRIORI; ANALYTICITY; FALLIBILISM).

4 Logic as first-order logic

Quine distinguishes the theory of reference from the theory of meaning. He is sceptical of notions associated with the theory of meaning, such as those of meaning, intension, synonymy, analyticity and necessity. By contrast, he relies on and makes contributions to the theory of reference, for example, to the understanding of logical truth, truth, reference and ontological commitment.

For Quine, the notion of logical truth falls squarely in the theory of reference. His most characteristic definition of logical truth is that a sentence is a logical truth if it is true and if it remains true when one uniformly replaces its nonlogical parts. The logical parts are the logical constants, signs for negation, disjunction, quantification and identity. 'Brutus killed Caesar or it is not the case that Brutus killed Caesar' is such a logical truth. In Quine's terminology the logical constants 'or' and 'it is not the case that' occur essentially, while the nonlogical part 'Brutus killed Caesar' can be uniformly varied and the resulting sentence will still be true. In other words a logical truth cannot be changed into a falsehood by varying the nonlogical expressions, whereas an ordinary truth can be.

The same concept of logical truth is found in BOLZANO and Ajdukiewicz. One of its virtues lies in its being parsimonious, that is, in what it does not say. Logical truth and related notions are often explained in modal terms. That is, logical truths are said to be distinguished by being 'necessary' or 'true in all possible worlds', and a valid argument is defined as one in which, if the premises are true, the conclusion 'must be true'. These accounts make logic presuppose modal notions. Quine's definition leaves logic autonomous in this respect. Indeed Quine is a critic of modal logic, challenging various attempts to explain the notion of necessity. Logical truth, as defined by Quine, is a precisely explained species of truth, fitting squarely inside the theory of reference. Quine relies on the concept of truth, which he construes along the lines of Tarski's theory (see TARSKI).

If logical truths are those in which only logical constants occur essentially, then the scope of logic is in part determined by what we take to be a logical constant. Quine lists as the logical constants the truth-functional connectives 'not', 'and', 'or', 'if . . . then', 'if and only if'; the quantifiers 'all' and 'some'; and the identity predicate '$a = b$'. The language of logic so construed is that of sentences formed out of truth-functional connectives, quantifiers, identity, schematic predicate letters and individual variables. Quantificational logic of this sort is also known as first-order logic. For Quine, logic *is* first-order logic with identity. Ruled out as logic on this construal are modal logic, because 'necessity' is not taken as a logical constant. Also excluded is higher-order logic, which has quantifiers for predicate positions (it is 'set theory in sheep's clothing' (*Philosophy of Logic* 1986)). On other grounds other proposals such as intuitionist logic are also ineligible. Set theory, and with it mathematics, are not logic (see LOGICAL CONSTANTS).

Quine falls in the camp of the logicist programme in holding that mathematics is reducible to set theory. Set theory is the theory of the 'is a member of' predicate and is stated in the language of first-order logic. Given the theory of membership and logic as first-order logic plus identity, Quine introduces mathematical notions as definitional abbreviations: for example, a number is defined as a special set, addition as a special function on these sets and so on. He argues that logic does not include set theory because membership should not be considered a logical constant for the following reasons. (1) There is a general consensus about elementary logic, which, given paradoxes such as Russell's, is lacking in the case of set theory. Alternative set theories have the status of so many tentative hypotheses. This lends credence to Quine's view that mathematics based on set theory is not very different from other sciences. (2) The incompleteness of set theory contrasts sharply with the completeness of elementary logic. (3) The ontology of set theory is not as topic-neutral as that of logic. The second item in the membership relation is restricted to sets. Logic is the most general of subjects, since the variables of logic are not restricted to any one category of objects (see LOGICISM §1).

5 Canonical notation and ontological commitment

Ever since Frege and Russell, existential quantification has been the prevalent way in which existence

assertions have been understood. The idea is that existence sentences in natural language can be paraphrased in the language of logic and 'existence' explicated by the existential quantifier of predicate logic. 'Existence is what existential quantification expresses' (*Ontological Relativity*). The functions that the predicate 'exists' performs in English can be accomplished by the '$\exists x$' quantifier. Quine's version of this theme is incorporated into his account of ontological commitment. The language of first-order predicate logic in which our ontological commitments are made is his 'canonical notation'.

> Taking the canonical notation thus austerely... we have just these basic constructions: predication, quantification ... and the truth functions ... What thus confronts us as a scheme for systems of the world is that structure so well understood by present-day logicians, the logic of quantification or calculus of predicates.
>
> Not that the idioms thus renounced are supposed to be unneeded in the market place or in the laboratory... The doctrine is only that such a canonical idiom can be abstracted and then adhered to in the statement of one's scientific theory. The doctrine is that all traits or reality worthy of the name can be set down in an idiom of this austere form if in any idiom.
>
> It is in spirit a philosophical doctrine of categories, ... philosophical in its breadth however continuous with science in its motivation.
>
> ('Carnap on Logical Truth' 1960)

A key reason for regarding this language as canonical is that in it one's use of the existential quantifier is explicit. To discover the existence assumptions or ontological commitments of a theory, we first state it in the language of truth-functional connectives and quantification, and then look at the existential quantifications we have made. The logic of '$\exists x$' is the logic of existence, and a notation that makes '$\exists x$' explicit accordingly makes our existence assumptions or ontological commitments explicit.

One of Quine's most famous remarks, 'to be is to be the value of a variable' (*From a Logical Point of View* [1953] 1988), sums up this criterion of ontological commitment. The slogan also incorporates one of Quine's elaborations on Russell's theory of definite descriptions. Russell held that in most sentences ordinary names are disguised definite descriptions, which on his theory are analysed as existential generalizations. Thus 'Socrates is human' becomes 'The one husband of Xanthippe is human' which in turn becomes the existential generalization 'There is one and only one husband of Xanthippe and he is human'. Quine's elaboration dispenses with names entirely. Wherever a name occurs in the original sentence, we can get by in the canonical notation with variables, predicates and the logical constants. If we do not have a definite description on hand to put in place of the name, we can form a predicate, such as 'Socratizes', then encapsulate the coined predicate in a definite description and define away the descriptions via Russell's theory. So names disappear and are not part of the canonical notation. Dispensing with names not only has the virtue of a more parsimonious notation: it also specifies that variables are the vehicles of reference and as such the grounds of ontological commitment. Being the value of a variable is what 'being' is all about (see Ontological commitment).

6 Competing ontologies

Some important philosophical differences concern competing ontologies. Physicalists, for instance, have as their basic objects physical objects, while phenomenalists have sense-data. A twentieth-century version of the problem of universals involves a dispute over the relative merits of: (1) a nominalistic ontology according to which only concrete individuals exist; and (2) realist ontologies, such as those of Platonists, which involve the existence of abstract objects. The issue of nominalism versus Platonism arises for Quine in connection with the mathematics required for science and the question whether it requires hypothesizing abstract objects such as sets. Another area of ontological controversy is whether Platonist assumptions should include only extensional objects such as sets or intensional ones such as properties or propositions (see Abstract objects; Nominalism).

While we look to the existential generalizations of a theory stated in canonical notation to see what its ontological commitments are, this does not answer the question of which ontological commitments we should have. As a naturalist and scientific realist, Quine regards this as a matter of epistemology. It is the question of which theory we ought to accept. Deciding on a theory (scientific or philosophical) and its attendant ontology is once again done within a scientific perspective. Appeal is made to the same theoretical concerns mentioned earlier, that is, explanatory power, parsimony, conservatism, precision and so on. Quine's own ontological commitments are the result of just such considerations. He is a physicalist, no longer taking seriously the phenomenalist programme; partly on grounds connected with the dogma of reductionism and partly on the grounds that sense-data are not needed in a naturalized epistemology (the functions

performed by sense-data are accomplished by nerve hits and observation sentences which are already part of our physicalist ontology). But he is a Platonist (a reluctant one) because of the mathematics that is required by our best scientific theories. In canonical notation, this mathematics requires quantifying over at least as many extensional abstract objects, namely sets, as there are real numbers. In an early essay co-authored with Nelson Goodman, 'Steps Towards A Constructive Nominalism' (1947), the possibilities of taking a nominalist stance were surveyed. But unlike Goodman, Quine reluctantly concluded that the nominalist programme failed. He has considered later attempts at nominalism such as by an appeal to substitutional quantification. The success of these attempts depends on whether impredicative notions are required by the mathematics embedded in the natural sciences. Others such as Field try to make the case for nominalism by abiding by some and abandoning other of Quine's constraints.

However, Quine has consistently argued against theories which require abstract objects of an intensional sort. An intensional notion might provisionally be characterized as one requiring for its explanation notions which do not conform to certain basic assumptions of first-order logic and standard set theories. Intensional contexts are not truth-functional, or do not allow the substitutability of coextensive singular terms or predicates. Modal notions are a case in point. 'Necessarily P' is not a truth-functional operation; we cannot replace singular terms or predicates in P, or the whole sentence P, with coextensive expressions and be guaranteed that if the original sentence is true then the subsequent one will also be true. In non-intensional contexts, that is, extensional contexts, such replacements are truth-preserving. Intensional objects are those that require intensional notions to account for them, such as properties or propositions. Extensional objects are those that do not require intensional notions to account for them, such as sets or sentences. So sets are identical if they have the same members, for example, the set of humans is the same as the set of featherless bipeds. Properties, on the other hand, are identical only if they necessarily belong to the same objects. So the properties of being human and being a rational animal are identical, but differ from the property of being a featherless biped.

Given Quine's views on the precision of notions from first-order logic and set theory, it is not surprising that he is critical of intensional notions which are not based on standard assumptions of first-order logic and set theory. His arguments against hypothesizing intensional objects are numerous and can be sketchily listed as cases where their explanatory power is questioned, where parsimony is invoked and where precise accounts of the identity conditions of such items is lacking ('no entity without identity'). Sometimes he argues that extensional ersatz constructions can achieve the same purpose for which the intensional objects were introduced: for instance, eternal sentences rather than propositions, sets rather than properties, ordered pairs rather than relations (construed intensionally), non-modal notions rather than modal ones, and so on (see Intensional entities).

7 Indeterminacy of reference and global structuralism

Quine's views on ontology undergo refinements in his later writings. Most important is the recognition that empiricism does not uniquely determine which objects are required as the values of our variables. There is an indeterminacy of reference which is in keeping with empiricist strictures on deciding which ontology to accept.

The thesis of ontological relativity, also known as the inscrutability or indeterminacy of reference, is in accord with Quine's naturalistic empiricism. It has been generalized into a view which he refers to as global structuralism. Since it is only at the observation sentences construed holophrastically as indissoluble wholes that the system is externally constrained, there are different but equally plausible ways of meeting these observational constraints and these can involve diverse ontologies, such as an ontology of rabbits or of rabbit parts. It is the structural part of the system that must be saved in order to meet the observational constraints. But this can be accomplished with quite different objects being the values of the variables. Quine endorses this global structuralist perspective by generalizing from his own cases and by noting a less global structuralist argument from the philosophy of mathematics. Quite different objects can be taken as the values of the variables for arithmetic, for example, numbers can be taken as Frege–Russell sets or as von Neumann sets without changing the truths of arithmetic. For Quine the question of whether we are really committed to rabbits as opposed to sums of rabbit parts, or to a given number as the set of all sets equinumerous to a given set (as on the Frege–Russell account) or to some different set (as on von Neumann's view) is without sense. It is without sense in that there is no natural-empirical way of raising this question. Global structuralism is a consequence of the denial of a first philosophy – a point of view in nature that transcends all natural points of view.

Quine's best-known cases which serve as evidence for his global structuralism are his rabbits case

and his proxy functions, especially that of cosmic complements. Intertwined with his discussion in *Word and Object* of a linguist translating a native speaker's utterance of 'Gavagai', Quine points out that construing that expression as a referring expression leaves no empirical way of deciding whether it is used to refer to rabbits, rabbit parts, or rabbit stages and so on. As a later example he asks us to consider how sentences about concrete objects can be reinterpreted in terms of different ontologies assigned as values of the variables so that there is no empirical way of saying which is the correct one. Indeed the message of structuralism is that it is an error to speak as though there were a uniquely correct referent. The sentence 'This rabbit is furry' is true and is usually interpreted as being about individual rabbits and individual furry things. However, if we reinterpret the referring portions in terms of mereological cosmic complements the sentence remains true and there is no empirical way if we do this uniformly to say which is the correct ontology. Thus assign to 'This rabbit' the entire cosmos less this rabbit (imagine a complete jigsaw puzzle with a rabbit piece removed; the cosmic complement would be the puzzle without the rabbit piece). Assign to the predicate 'is furry' each of the cosmic complements of individual furry things. The sentence 'This rabbit is furry' is true under such an interpretation because the cosmos less this rabbit is a member of the set of cosmic complements of individual furry things (that is, that set includes the cosmic complement of that individual rabbit). One can extend this treatment of singular sentences to the remaining referential sentences.

8 The theory of meaning: its myths and dogmas

Quine's reaction in the 1930s to Carnap's work was a sceptical critique of the prevalent view among analytic philosophers that logic and mathematics are justified in some distinctively linguistic way, that is, that they are based on merely analytic-linguistic truths – truths by convention. The scepticism then and later questions proposed accounts of the distinction. Linguistic truth or truth by convention, as opposed to non-conventionally based empirical truths, appears in the end to be a purported distinction without a real difference. Of special importance is the failure to satisfy the requirement of precision in explaining the distinction. In 'Truth By Convention' (1936) and 'Carnap on Logical Truth' (1960), Quine takes up different attempts to characterize such truths and finds that for the most part they are either too broad – not distinctive of logic or mathematics – or require non-linguistically based truth. There are as many of these characterizations as there are different senses of 'convention'. Quine considers truth by convention as based on the following: the arbitrary factor in axiomatization; formalization-disinterpretation; the arbitrary element in hypothesizing; and definition. But neither logic nor mathematics is distinguished by being axiomatized, or formalized-disinterpreted. The same can be done for other disciplines, such as physics and biology. The somewhat arbitrary choice of which sentences to take as axioms, so long as we can prove the right sentences, is also not distinctive of them. If truth by convention is taken as the somewhat arbitrary element in framing hypotheses, then this too is not distinctive of logic or mathematics. Nor are the formulas involved distinguished by being true by definition. Thus, if '$p \rightarrow p$' is defined in terms of '$-p \vee p$', then the truth of the defined formula depends on the truth of the defining formula, and that formula's truth is not a matter of definition or convention. For Quine, logic and mathematics can be precisely characterized in terms from the theory of reference. Logic is described in terms of truth, the logical constants and interchange of the extralogical elements; mathematics can be characterized in terms of set theory. But neither of these subjects is distinct in having a different epistemological basis which results in their being in some interesting sense 'analytic' or mere 'linguistic truths'.

The 'Two Dogmas' of Quine's 1951 essay were the dogma of reduction (see §3 earlier) and the dogma of the analytic/synthetic distinction. In discussing the dogma of analyticity, Quine questions, as he did in 'Truth by Convention', whether the distinction can be well made. Here he rejects five ways of explaining analyticity. These involve appeals to: (1) meanings, (2) definition, (3) interchangeability, (4) semantic rules and (5) the verifiability theory of meaning.

(1) 'Bachelors are unmarried men' might be regarded as analytic, where that notion is explained as truth in virtue of the meanings of its words. One suggestion is that the meaning of 'unmarried man' is included in the meaning of 'bachelor'. Another approach would hypothesize the existence of meanings to explain synonymy and then use synonymy in turn to show how the above sentence is a synonymous instance of a logical truth. The success of the above explanations requires assuming that there are such things as precisely characterizable meanings. Quine is sceptical of this assumption. He rejects three accounts of meanings: (a) referential theories – meanings as referents; (b) mentalism – meanings as ideas; and (c) intensionalism – meanings as intensional entities. Meaning (or sense), as Frege taught, must be distinguished from reference.

The notion of meaning that is to explain synonymy and analyticity cannot simply be reference, because coreferential terms need not be synonymous and so will not distinguish analytic sentences from true non-analytic ones. Truth in virtue of meaning where meaning is simply reference is too broad as all truths would then be analytic. As to meanings as ideas, Quine brings to bear empiricist and behaviourist qualms. The account of meanings as abstract intensional entities is found in Frege, Carnap and Church. Quine maintains that such intensional objects are neither required as posits by our theories of language, nor are they precisely accounted for. The attempt to explain intensional notions is either circular or unhelpful. There is a circle of intensional notions, meaning, synonymy, analyticity, necessity, and we can define one in terms of another. Quine's criticism is that if we do not break out of this intensional circle, then the account has failed to clarify the matter. For example, if the meaning of a predicate 'is human' is the property of being human, how would one go about identifying whether 'being a rational animal' or 'being a featherless biped' stood for the same property or had the same meaning? One answer is that the sentence 'humans are rational animals' is analytic, while the sentence 'humans are featherless bipeds' is not. But this relies on the notion of 'analytic' – which we haven't yet defined. Another approach at giving an identity condition uses modal notions and says that the first sentence is a necessary truth while the second is not. This, however, raises the problem of giving a precise account of modal notions. Explaining modal claims in terms of analyticity, for example, 'Necessarily humans are rational' as explained by '"Humans are rational" is analytic', will not do – since we have not defined 'analytic'. Quine's challenge is that one break out of this intensional circle and explain notions from the theory of meaning in more acceptable terms.

(2) He next rejects accounts of analyticity in terms of logical truth and synonymy. On this account a sentence is analytic if it is a synonymous instance of a logical truth, that is, 'All bachelors are unmarried men' is analytic in that it is derivable from the first-order logical truth 'All bachelors are bachelors' by putting a synonym 'unmarried man' for the second occurrence of 'bachelor'. One account attempts to explain synonymy in terms of definition. However, the various forms of definition either presuppose synonymy or stipulate it; none explain it. Quine is sceptical of definitions or philosophical analysis when thought of as capturing or analysing some concept or meaning. Instead philosophical explication is thought of in terms of the theory of reference and scientific hypothesizing and thus again embodying the naturalistic theme of the continuity of science and philosophy. One does not capture 'the meaning' of an expression; one explicates or proposes a theory of the referential features one is interested in preserving.

(3) Another attempt to define synonymy asserts that two expressions are synonymous if they are interchangeable. But it is not enough to say expressions are synonymous when the interchange of the one with the other within extensional contexts does not change the truth value of the sentences involved. This has the unacceptable consequence that merely coextensive terms would be synonyms. To do better one has to require interchangeability within intensional contexts. However, this raises the problem of breaking out of the circle of intensional notions.

(4) The fourth approach is another of Carnap's. It consists in constructing an artificial language and then defining 'analytic' for it. While it is possible to construct a language and specify that relative to it logic, mathematics and such truths as 'All bachelors are unmarried men' and 'Nothing is larger than itself' are analytic, this language-relative specification of analyticity does not clarify matters. It does not help to be told that in one language, language 1 (artificial or otherwise), we have a list of sentences that are analytic 1, and that in another language, language 2, we have the list analytic 2 and so on. What we want of an explication of analyticity is an account of what analytic 1, analytic 2 and so on have in common. The appeal to artificial languages fails to provide this characterization. Moreover, the problem is precisely why 'All bachelors are unmarried' is on the list and 'No bachelors are six-legged' is not. To be told that a sentence is analytic because it is on a list (even the list of an artificial language) provides no real distinction.

(5) The last attempt to define analyticity that Quine considers appeals to the verification theory of meaning. According to this theory, 'the meaning of a statement is the method of empirically confirming or infirming it'; 'statements are synonymous if and only if they are alike in point of method of empirical confirmation or infirmation' ([1953] 1988). Though sympathetic towards the empiricist thrust of this theory Quine does not think it survives the holistic criticism of the dogma of reductionism.

Quine's critique of the theory of meaning has amounted to a challenge to provide precise accounts of its notions. What counts as precise could take the form of reducing intensional notions to extensional ones. His criticisms of modal concepts has spurred a generation of responses in what is known as possible world semantics, which in one of its variations can be seen as trying to provide a reduction of

intensional modal notions via extensional metalinguistic truth conditions for modal statements. The success of this reduction is still challenged by Quinians. More in keeping with Quine's challenge to explicate the theory of meaning is Davidson's work on letting a Tarskian theory of truth serve as surrogate for a theory of meaning. Another way in which scepticism about the theory of meaning might be overcome would be by an empirical and behaviouristically constrained account of such notions. Carnap took up this challenge and sketched a programme for empirically identifying meanings by testing translation hypotheses, for example, a linguist's hypotheses for translating the terms 'Pferd' from German to English as 'horse'. Quine's response was the topic of radical translation and his thesis of the indeterminacy of translation.

9 Indeterminacy of translation

How much of language is susceptible to empirical analysis? Like Carnap, Quine takes the case of linguists hypothesizing about translations as the subject matter for empirical inquiry. Both take as their data the intersubjectively available public phenomena of native speakers responding to appropriate stimuli. Quine introduces the concept of the stimulus meaning of a sentence for a person as the class of stimulations which would prompt them to assent to it. But Quine deals with the stimulus meaning of whole sentences, such as 'This is a horse', construed as holophrastic fused expressions, such as 'Here-is-a-horse', and not terms, such as 'horse'. Quine's linguist offers a hypothesis equating two such fused sentences (one is the native's and the other the linguist's) and checks it against a native speaker's assenting or dissenting to the native sentence in the presence of some nonverbal stimulus. One reason for adopting such holophrastic sentences is that we are dealing with the entering wedge in learning a language. In the crucial radical translation case Quine's field linguist is in a somewhat similar position to an infant who is learning a language without having any prior linguistic skills. That is, we are initially concerned with the public conditions in learning those parts of a language (one-word sentences) that do not involve knowledge of other parts of the language, especially those parts that are remote from the stimulus conditions. These sentences that serve as the entering wedge are Quine's observation sentences, and they also serve as an observational base for testing scientific theories. Carnap considered translation for languages such as German and English, which are known to have much in common. For Quine, the critical case is that of radical translation, that is, translations between languages that have little or nothing in common. Think of a linguist among some radically foreign tribe. The linguist observes a certain correlation between a native utterance of 'Gavagai' and the presence of rabbits and proceeds to frame a hypothesis which equates 'Gavagai' and the one-word sentence 'Rabbit', short for 'Here's-a-rabbit'. The linguist could, on learning how to recognize the native's assent and dissent, question the native by uttering 'Gavagai' when a rabbit appears and seeing whether the native assents. Carnap would presumably want this to count as evidence that the terms in a sentence 'gavagai' and 'rabbit' have the same meaning. But does the evidence really go that far? All that we have as data is the native's expression and the rabbit stimulation. Quine claims that on these grounds one could equally well translate the holophrastic sentence 'Gavagai' as 'Here's-a-rabbit', 'Here's-a-rabbit-stage' or 'Here's-a-temporal-part-of-a-rabbit' or something else. For wherever there are rabbit stimulations there are also rabbit-stage stimulations, etc. On what basis then would one decide between these different translations? In the case of culturally similar languages one assumes a stock of more theoretical guides to translations and thus one can ask the German whether all horses are Pferde and all Pferde are horses. Such theoretical guides (Quine refers to them as 'analytical hypotheses') appear among the remoter parts of language that cannot be what the infant or field linguist has access to at the initial stage of learning a language. In the case of radical translation, the linguist is not in a position to pose more theoretical questions about the remoter portions of a language. At this point hypotheses less directly connected to the data – to the stimulus conditions – may be introduced by the linguist. These analytical hypotheses can be framed so as to do justice to quite different incompatible translations. Thus radical translation provides evidence for the conjecture of the indeterminacy of translation (see RADICAL TRANSLATION AND RADICAL INTERPRETATION).

To illustrate this matter for the Gavagai case we must note that in order to ask the question 'Is this rabbit the same as that?' the linguist must have decided how to translate articles, pronouns, identity predicates and so on. To translate these sentences is to go far beyond the data provided by the stimuli and involves selecting from different sets of analytical hypotheses, that is, different possible manuals of translation. On one set of these we translate the question as 'Is this the same rabbit as that?', while on another as 'Is this rabbit stage of the same series as that?' Each of these translations is equally good, yet they are mutually incompatible. Since neither of these has any immediate connection with the Gavagai stimulation there is no way of deciding between them.

This indeterminacy provides further grounds for discrediting the notion of meaning. Philosophers have talked as if meanings are related to expressions in somewhat the same way as paintings in a museum are related to their labels. Quine dubs this 'the myth of the museum'. According to this view, two expressions are synonymous when they are related to a unique meaning, like two labels for the same painting. In the case of translation, one English expression is a translation of another in a different language when the two bear a relation to one and the same interlinguistic object which is their meaning. Quine is attempting to dislodge this model for thinking about language and to put in its place a more empirically based conception. According to the museum model, an expression has its meaning, pure and simple, and two synonymous expressions relate uniquely to one meaning which, as interlinguistic, is independent of the languages in which it is expressed. What Quine has shown is that it makes no sense to speak of language-independent meanings. Translation from one language to another is relative to a set of analytical hypotheses. There is no independent meaning of 'Gavagai' which the linguist can link to 'Here's-a-rabbit' and not 'Here's-a-rabbit-stage'. The three sentences are stimulus synonymous. The public data does not yield the result that it is only the first two which are supposed to be synonymous in the full-blooded/museum model sense of expressing one and the same unique proposition. The linguist is at best in a position of saying that 'Gavagai' and 'Here's-a-rabbit' are synonymous relative to the assumption of certain analytical hypotheses. We have to study language in terms of linguistic behaviour in the face of publicly accessible stimulus conditions; in turn this behaviour must be interpreted in relation to more theoretical background assumptions. With the exception of observation sentences, we have at best relative notions of meaning (synonymy and analyticity), and these will not do the job philosophers have frequently assigned to them according to the myth of the museum. If one cannot empirically uniquely determine the full blooded meaning/proposition that is posited in the theory of meaning for sentences so close to stimulus conditions then the prospects are even worse for the rest of language which is remote from these conditions, sentences like: 'Frank's uncle is overweight', 'Heredity is a matter of genes' or '2 + 2 = 4'.

Quine and the later WITTGENSTEIN are two of the most rigorous thinkers who anchor language in public conditions. For Wittgenstein this leads to the denial of private languages and Kripke's puzzle about acquiring determinate rules. (see KRIPKE, S.A.). For Quine the public learning of language yields in the theory of reference the thesis of the indeterminacy/inscrutability of reference and in the theory of meaning the conjecture of the indeterminacy of meaning. Quine insists on behaviourism as the required method for studying language learning. He argues that we learn language by observing verbal behaviour and having our verbal behaviour reinforced by others. But there are naturalistic accounts of language learning which are scientifically respectable and not behaviourist (see CHOMSKY, N.). Yet although Quine insists on behaviourism as the method for studying and acquiring languages, he is not a behaviourist in psychology or the philosophy of mind. On the mind–body problem he endorses Davidson's anomalous monism – the view that our ways of speaking of the mental, for example, of perceptions and beliefs, cannot be stated in terms of the natural laws which govern the underlying physiological states, even though our mental states just are such states. Quine construes the matter so that mental ascriptions have a role in everyday life and the social sciences that cannot be precisely specified in purely physiological or physicalist terms.

RADICAL TRANSLATION AND RADICAL INTERPRETATION

Radical translation is the setting of a thought experiment conceived by W.V. Quine in the late 1950s. In that setting a linguist undertakes to translate into English some hitherto unknown language – one which is neither historically nor culturally linked to any known language. It is further supposed that the linguist has no access to bilinguals versed in the two languages, English and (what Quine called) 'Jungle'. Thus, the only empirical data the linguist has to go on in constructing a 'Jungle-to-English' translation manual are instances of the native speakers' behaviour in publicly recognizable circumstances. Reflecting upon the fragmentary nature of these data, Quine draws the following conclusions.

(1) It is very likely that the theoretical sentences of 'Jungle' can be translated as wholes into English in incompatible yet equally acceptable ways. In other words, translation of theoretical sentences is indeterminate. On the assumption that a sentence and its translation share the same meaning, the import of indeterminacy of translation is indeterminacy of meaning: the meanings of theoretical sentences of natural languages are not fixed by empirical data. The fact is, the radical translator is bound to impose about as much meaning as they discover. This result (together with the dictum 'no entity without identity') undermines the idea that propositions are meanings of sentences.
(2) Neither the question of which 'Jungle' expressions are to count as terms nor the question of what object(s), if any, a 'Jungle' term refers to can be answered by appealing merely to the empirical data. In short, the empirical data do not fix reference.

The idea of *radical interpretation* was developed by Donald Davidson in the 1960s and 1970s as a modification and extension of Quine's idea of radical translation. Quine is concerned with the extent to which empirical data determine the meanings of sentences of a natural language. In the setting of radical interpretation, Davidson is concerned with a different question, the question of what a person could know that would enable them to interpret another's language. For example, what could one know that would enable the interpretation of the German sentence 'Es regnet' as meaning that it is raining? The knowledge required for interpretation differs from the knowledge required for translation, for one could know that 'Es regnet' is translated as 'Il pleut' without knowing the meaning (the interpretation) of either sentence. Beginning with the knowledge that the native speaker holds certain sentences true when in certain publicly recognizable circumstances, Davidson's radical interpreter strives to understand the meanings of those sentences. Davidson argues that this scenario reveals that interpretation centres on one's having knowledge comparable to an empirically verified, finitely based, recursive specification of the truth-conditions for an infinity of sentences – a Tarski-like truth theory. Thus, Quine's radical translation and Davidson's radical interpretation should not be regarded as competitors, for although the methodologies employed in the two contexts are similar, the two contexts are designed to answer different questions. Moreover, interpretation is broader than translation; sentences that cannot be translated can still be interpreted.

RAMIFIED TYPE THEORY

See THEORY OF TYPES

RAMSEY, FRANK PLUMPTON (1903–30)

Before Ramsey died at the age of 26 he did an extraordinary amount of pioneering work, in economics and mathematics as well as in logic and philosophy. His major contributions to the latter are as follows. (1) He produced the definitive version of Bertrand Russell's attempted reduction of mathematics to logic. (2) He produced the first quantitative theory of how we make decisions, for example about going to the station to catch a train. His theory shows how such decisions depend on the strengths of our beliefs (that the train will run) and desires (to catch it), and uses this dependence to define general measures of belief and desire. This theory also underpins his claim that what makes induction reasonable is its being a reliable way of forming true beliefs, and it underpins his equation of knowledge generally with reliably formed true beliefs. (3) He used the equivalence between believing a proposition and believing that it is true to define truth in terms of beliefs. These in turn he proposed to define by how they affect our actions and whether those actions fulfil our desires. (4) He produced two theories of laws of nature. On the first of these, laws are the generalizations that would be axioms and theorems in the simplest true theory of everything. On the second, they are generalizations that lack exceptions and would if known be used to support predictions ('I'll starve if I don't eat') and hence decisions ('I'll eat'). (5) He showed how established, for example optical, phenomena can be explained by theories using previously unknown terms, like 'photon', which they introduce. (6) He showed why no grammatical distinction between subjects like 'Socrates' and predicates like 'is wise' entails any intrinsic difference between particulars and universals.

D.H. MELLOR

RAMUS, PETRUS (1515–72)

Petrus Ramus, for many years a professor of philosophy and eloquence at the University of Paris, wrote textbooks and controversial works in grammar, logic, rhetoric, mathematics, physics and philosophy. He was also a university reformer. His followers were prolific with commentaries, Ramist analyses of classical texts and handbooks of their own. His logical works and those of his school exercised a large influence between 1550 and 1650.

His formation was humanist, in that he attacked scholasticism and encouraged the study (and logical analysis) of classical texts, as Agricola, Sturm and Melanchthon had done. But he was far more independent-minded than them, a stern critic of the textbooks of Aristotle and Cicero, as well as an admirer of their style and intellect. His most important innovation was the method, a theory of organization which he used to simplify his textbooks. He emphasized the need for learning to be comprehensible and useful, with a particular stress on the practical aspect of mathematics. His critics would say he oversimplified. He was also a student of Gaulish pseudo-antiquities and an important proponent of the French language. His *Dialectique* (1555) was the first book on dialectic in French.

RANDOMNESS

The fundamental intuition underlying randomness is the absence of order or pattern. To cash out this intuition philosophers and scientists employ five approaches to randomness.

(1) Randomness as the output of a chance process. Thus an event is *random* if it is the output of a chance process. Moreover, a sequence of events constitutes a *random sample* if all events in the sequence derive from a single chance process and no event in the sequence is influenced by the others.

(2) Randomness as mimicking chance. Statisticians frequently wish to obtain a random sample (in the sense of (1)) according to some specified probability distribution. Unfortunately, a chance process corresponding to this probability distribution may be hard to come by. In this case a statistician may employ a computer simulation to mimic the desired chance process (for example, a random number generator). Randomness *qua* mimicking chance is also known as *pseudo-randomness*.

(3) Randomness via mixing. Consider the following situation: particles are concentrated in some corner of a fluid; forces act on the fluid so that eventually the particles become thoroughly mixed throughout the fluid, reaching an equilibrium state. Here randomness is identified with the equilibrium state reached via mixing.

(4) Randomness as a measure of computational complexity. Computers are ideally suited for generating bit strings. The length of the shortest program that generates a given bit string, as well as the minimum time it takes for a program to generate the string, both assign measures of

complexity to the strings. The higher the complexity, the more random the string.

(5) Randomness as pattern-breaking. Given a specified collection of patterns, an object is random if it breaks all the patterns in the collection. If, on the other hand, it fits at least one of the patterns in the collection, then it fails to be random.

WILLIAM A. DEMBSKI

RATIONAL CHOICE THEORY

Rational choice theory is the descendant of earlier philosophical political economy. Its core is the effort to explain and sometimes to justify collective results of individuals acting from their own individual motivations – usually their own self interest, but sometimes far more general concerns that can be included under the rubric of preferences. The resolute application of the assumption of self-interest to social actions and institutions began with Hobbes and Machiavelli, who are sometimes therefore seen as the figures who divide modern from early political philosophy. Machiavelli commended the assumption of self-interest to the prince; Hobbes applied it to everyone. Their view of human motivation went on to remake economics through the work of Mandeville and Adam Smith. And it was plausibly a major factor in the decline of virtue theory, which had previously dominated ethics for many centuries.

Game theory was invented almost whole by the mathematician von Neumann and the economist Morgenstern during the Second World War. Their theory was less a theory that made predictions or gave explanations than a framework for viewing complex social interactions. It caught on with mathematicians and defence analysts almost immediately, with social psychologists much later, and with economists and philosophers later still. But it has now become almost necessary to state some problems game theoretically in order to keep them clear and to relate them to other analyses. The game-theory framework represents ranges of payoffs that players can get from their simultaneous or sequential moves in games in which they interact. Moves are essentially choices of strategies, and outcomes are the intersections of strategy choices. If you and I are in a game, both of us typically depend on our own and on the other's choices of strategies for our payoffs.

The most striking advance in economics in the twentieth century is arguably the move from cardinal to ordinal value theory. The change had great advantages for resolving certain classes of problems but it also made many tasks more difficult. For example, the central task of aggregation from individual to collective preferences or utility could be done – at least in principle – as a matter of mere arithmetic in the cardinal system. In that system, Benthamite utilitarianism was the natural theory for welfare economics. In the ordinal system, however, there was no obvious way to aggregate from individual to collective preferences. We could do what Pareto said was all that could be done: we could optimize by making those (Pareto) improvements that made at least one person better off but no one worse off. But we could not maximize. In his impossibility theorem, Arrow showed that, under reasonable conditions, there is no general method for converting individual to collective orderings.

After game theory and the Arrow impossibility theorem, the next major contribution to rational choice theory was the economic theory of democracy of Downs. Downs assumed that everyone involved in the democratic election system is primarily self-interested. Candidates are interested in their own election; citizens are interested in getting policies adopted that benefit themselves. From this relatively simple assumption, however, he deduced two striking results that ran counter to standard views of democracy. In a two-party system, parties would rationally locate themselves at the centre of the voter distribution; and citizens typically have no interest in voting or in learning enough to vote in their interests even if they do vote.

The problem of the rational voter can be generalized. Suppose that I am a member of a group of many people who share an interest in having some good provided but that no one of us values its provision enough to justify paying for it all on our own. Suppose further that, if every one of us pays a proportionate share of the cost, we all benefit more than we pay. Unfortunately, however, my benefit from my contribution alone might be less than the value of my contribution. Hence, if our contributions are strictly voluntary, I may prefer not to contribute a share and merely to enjoy whatever follows from the contributions of others. I am then a free-rider. If we all rationally attempt to be free-riders, our group fails and none of us benefits.

A potentially disturbing implication of the game-theoretic understanding of rationality in interactive choice contexts, of the Arrow impossibility theorem, of the economic theory of democracy and of the logic of collective action is that much of philosophical democratic theory, which is usually normative, is irrelevant to our possibilities. The things these theories often tell us we should be doing cannot be done.

RUSSELL HARDIN

RATIONALISM

Rationalism is the view that reason, as opposed to, say, sense experience, divine revelation or reliance on institutional authority, plays a dominant role in our attempt to gain knowledge. Different forms of rationalism are distinguished by different conceptions of reason and its role as a source of knowledge, by different descriptions of the alternatives to which reason is opposed, by different accounts of the nature of knowledge, and by different choices of the subject matter, for example, ethics, physics, mathematics, metaphysics, relative to which reason is viewed as the major source of knowledge. The common application of the term 'rationalist' can say very little about what two philosophers have in common.

Suppose we mean by reason our intellectual abilities in general, including sense experience. To employ reason is to use our individual intellectual abilities to seek evidence for and against potential beliefs. To fail to employ reason is to form beliefs on the basis of such non-rational processes as blind faith, guessing or unthinking obedience to institutional authority. Suppose too that we conceive of knowledge as true, warranted belief, where warrant requires that a belief be beyond a reasonable doubt though not beyond the slightest doubt. Here, then, is a version of rationalism: reason is the major source of knowledge in the rational sciences. This is a weak version of rationalism which simply asserts that our individual intellectual abilities, as opposed to blind faith and so on, are the major source of knowledge in the natural sciences. It is clearly not very controversial and is widely accepted.

Suppose, however, we take reason to be a distinct faculty of knowledge distinguished from sense experience in particular. To employ reason is to grasp self-evident truths or to deduce additional conclusions from them. Suppose we conceive of knowledge as true, warranted belief, where warrant now requires that a belief be beyond even the slightest doubt. Let us also extend our attention to metaphysics and issues such as the existence of God, human free will and immortality. Here is a much stronger version of rationalism which asserts that the intellectual grasp of self-evident truths and the deduction of ones that are not self-evident is the major source of true beliefs warranted beyond even the slightest doubt in the natural sciences and metaphysics. Clearly it is highly controversial and not very widely accepted.

The term 'rationalism' has been used to cover a range of views. Scholars of the Enlightenment generally have in mind something like the first example – a general confidence in the powers of the human intellect, in opposition to faith and blind acceptance of institutional authority, as a source of knowledge – when they refer to the rationalist spirit of the period and the work of such philosophers as Voltaire. Most frequently, the term 'rationalism' is used to refer to views, like the second one above, which introduce reason as a distinct faculty of knowledge in contrast to sense experience. Rationalism is then opposed to empiricism, the view that sense experience provides the primary basis for knowledge.

RATIONALITY AND CULTURAL RELATIVISM

Under what conditions may we judge the practices or beliefs of another culture to be rationally deficient? Is it possible that cultures can differ so radically as to embody different and even incommensurable modes of reasoning? Are norms of rationality culturally relative, or are there culture-independent norms of rationality that can be used to judge the beliefs and practices of all human cultures?

In order to be in a position to make judgments about the rationality of another culture, we must first understand it. Understanding a very different culture itself raises philosophical difficulties. How do we acquire the initial translation of the language of the culture? Can we use our categories to understand the social practices of another culture, for instance, our categories of science, magic and religion? Or would the mapping of our categories on to the practices of culturally distant societies yield a distorted picture of how they construct social practices and institutions?

A lively debate has revolved around these questions. Part of the debate involves clarifying the difficult concepts of rationality and relativism. What sort of judgments of rationality are appropriate? Judgments about how agents' reasons relate to their actions? Judgments about how well agents' actions and social practices conform to the norms of their culture? Or judgments about the norms of rationality of cultures as such? Can relativism be given a coherent formulation that preserves the apparent disagreements for which it is meant to account?

Can there be incommensurable cultures, such that one culture could not understand the other? According to Donald Davidson's theory of interpretation, radical translation requires the use of a principle of charity that in effect rules out the possibility of incommensurable cultures. If this result is accepted, then a strong form of cultural

relativism concerning norms of rationality is also ruled out.

Davidson's theory, some argue, does not eliminate the possibility of attributing irrational beliefs and practices to agents in other cultures, and thus still leaves some room for debate about how to understand and evaluate such beliefs and practices. Three positions frame the debate. The intellectualist position holds that judgments of rationality are in order across cultures. The symbolist and functionalist positions, here taken together, try to avoid such judgments by attributing functions or symbolic meanings to cultural practices that are generally not understood as such by the agents. The fideist position, wary of too easily being ethnocentric, assumes a more relativist stance with regard to cross-cultural judgments of rationality.

LAWRENCE H. SIMON

RATIONALITY, PRACTICAL

Whereas theoretical reason is that form of reason that is authoritative over belief, practical reason is that form of reason that applies, in some way, to action: by either directing it, motivating it, planning it, evaluating it or predicting it. Accounts of practical reason include theories of how we should determine means to the ends we have; how we should define the ends themselves; how we should act given that we have a multiplicity of ends; how requirements of consistency should govern our actions; and how moral considerations should be incorporated in our deliberations about how to act.

Economics has provided, in recent times, what many regard as the most compelling portrait of practical reason, called 'expected utility theory' (hereafter 'EU theory'). On this theory, rational action is that action which yields the highest expected utility, which is calculated by measuring the utility – or the 'goodness' or 'badness' – of the possible outcomes of the action, multiplying the utility of each outcome by the probability that it will occur, and, finally, adding together the results for all the possible outcomes of each action. The action that has the highest expected utility is the rational action. Other technical representations of practical reason have been explored in the branch of social science called 'game theory', which studies 'strategic' situations in which the action that is rational for any agent depends in part on what other agents do.

A theory of practical reason can have one or more of several different goals. If it sets out how human beings *actually* reason, it functions as a *descriptive* theory of reasoning. If it sets out a conception of how our reasoning *ought* to proceed, it functions as a *normative* theory of reasoning. Theories of reason can also be about actions themselves: if a theory presents a conception of the way our actions should be intelligible or consistent or useful (regardless of the quality of the deliberation that preceded it), it functions as a (normative) theory of behavioural rationale. If it merely presents an account of consistent action that allows us to predict the behaviour of an agent whose previous actions fit this account of consistency, it functions as a descriptive theory.

One might say that whereas theoretical reason is supposed to pursue truth, practical reason is supposed to pursue some sort of good or value in human action. Theories that take rational action to be that which achieves, furthers or maximizes (what is regarded as) good, are *consequentialist* or *teleological* theories. Theories that believe rational action must sometimes be understood as action that has an intrinsic value or 'rightness' regardless of how much good it will accomplish or manifest, are non-consequentialist or non-teleological conceptions of reason. If the theory defines reason as that which serves ends defined by something other than itself, it is an *instrumental* conception. If it allows reason to have a non-instrumental role, itself capable of establishing at least some of our ends of action, it is setting out a non-instrumental conception. Theories of practical reason that recognize the existence of a special moral reasoning procedure tend to represent that procedure as non-instrumental.

Philosophers have disagreed about whether practical reason gives us a way of reasoning prior to choice that can actually motivate us to behave in the way that it directs. Many believe it lacks motivational power, so that it can only give us authoritative directives that must be motivated by something else (for example, by our desires). Finally, the study of practical reason also considers the variety of ways in which one can fall short of being rational; and issues about the nature and possibility of irrational 'weakness of will' have been central to this discussion.

JEAN HAMPTON

RAWLS, JOHN (1921–2002)

Introduction

Rawls' main work, *A Theory of Justice*, presents a liberal, egalitarian, moral conception – 'justice as

fairness' – designed to explicate and justify the institutions of a constitutional democracy. The two principles of justice outlined in this text affirm the priority of equal basic liberties over other political concerns, and require fair opportunities for all citizens, directing that inequalities in wealth and social positions maximally benefit the least advantaged. Rawls develops the idea of an impartial social contract to justify these principles: free persons, equally situated and ignorant of their historical circumstances, would rationally agree to them in order to secure their equal status and independence, and to pursue freely their conceptions of the good.

In *Political Liberalism*, his other major text, Rawls revises his original argument for justice as fairness to make it more compatible with the pluralism of liberalism. He argues that, assuming that different philosophical, religious and ethical views are inevitable in liberal society, the most reasonable basis for social unity is a public conception of justice based in shared moral ideas, including citizens' common comception of themselves as free and equal moral persons. The stability of this public conception of justice is provided by an overlapping consensus; all the reasonable comprehensible philosophical, religious and ethical views can endorse it, each for their own specific reasons.

1 Justice as fairness

Rawls' overriding aim is 'to provide the most appropriate moral basis for a democratic society' (1971: viii). Despite its many strengths, he sees the dominant utilitarian tradition as providing deficient foundations for democracy. Rawls begins with a normative conception of persons, whom he describes as free, equal, rational and endowed with a moral capacity for a sense of justice. Because of differences in knowledge and situations, free persons inevitably will develop different conceptions of the good. To pursue their good, they make conflicting claims on scarce resources. Principles of justice regulate the division of benefits and burdens resulting from social cooperation. Rawls contends that the appropriate way to decide principles for a democratic society is by conjecturing what principles free persons would agree to among themselves to regulate basic social institutions (the political constitution, property, markets and the family). But to ensure this agreement is fair, they must abstract knowledge of their own situations – of their talents and social positions and their conceptions of the good. Since these principles will be used to assess the justice of existing institutions and the reasonableness of existing desires and claims, Rawls further envisages that contracting parties abstract not just awareness of their own, but everyone's historical circumstances, desires and conceptions of the good. They are to be placed behind a thick 'veil of ignorance'. What such free individuals do know are general social, economic, psychological, and physical theories of all kinds. They also know there are certain all-purpose means that are essential to achieving their good, whatever it might be. These 'primary social goods' are rights and liberties, powers and opportunities, income and wealth, and the basis of self-respect.

The effect of these restrictions on knowledge is to render Rawls' parties strictly equal. This enables Rawls to carry to the limit the intuitive idea of the democratic social contract tradition: that justice is what could, or would, be agreed to among free persons from a position of equality (see CONTRACTARIANISM). Rawls sees his strong equality condition, along with other moral conditions on agreement (that principles be universal, general, publicly known, final, and so on), as reasonable restrictions on arguments for principles of justice for the basic structure of society. These conditions define the 'original position', the perspective from which rational agents are to unanimously agree. Parties to the original position are presented with a list of all known feasible conceptions of justice and consider them in pairwise comparisons. The parties are rational, in that all utilize effective means to secure their ends, and are motivated by their interests, and so are moved to acquire an adequate share of the primary social goods needed to pursue their interests. The parties are also assumed to be rationally prudent (with zero time-preference), mutually disinterested (of limited altruism) and without envy.

Given these conditions, Rawls argues that the parties would unanimously agree to justice as fairness over the classical and average principles of utility, perfectionist and intuitionistic conceptions, and rational egoism. Its main principles state: (1) each person has an equal right to a fully adequate scheme of equal basic liberties, compatible with a similar scheme of liberties for all; and (2) social and economic inequalities must be attached to offices and positions open to all under conditions of fair equality of opportunity and must be to the greatest benefit of the least advantaged members of society (the 'difference principle'). The basic liberties of the first principle are liberty of conscience, freedom of thought, equal political rights, freedom of

association, freedoms specified to maintain the liberty and integrity of the person (including rights to personal property), and the rights and liberties covered by the rule of law. These liberties are basic in that they have priority over the difference principle; their equality cannot be infringed, even if inequalities would increase the opportunities or wealth of those least advantaged. Moreover, the rights implied by both principles have priority over all other social values: they cannot be infringed or traded for the sake of efficiency, others' likes and dislikes or perfectionist values of culture.

Rawls' argument for these principles is that, given complete ignorance of everyone's position, it would be irrational to jeopardize one's good to gain whatever marginal advantages might be promised by other alternatives. For included in one's conception of the good are the religious and philosophical convictions and ethical ways of life that give one's existence meaning. It is fundamentally irrational, Rawls contends, to gamble with these given complete ignorance of risks and probabilities. In his later work, Rawls contends that parties in the original position are also moved by 'higher-order interests' to develop and exercise the 'moral powers' that enable them to engage in social cooperation – the capacity to form, revise and rationally pursue a conception of the good, and the capacity to understand, apply and act from a sense of justice. Parties agree on the two principles underlying justice as fairness since they provide each with primary goods adequate to realize these powers; other alternatives jeopardize these conditions.

One objection to Rawls' theory is that the parties' 'maximin' strategy of choice is too conservative. Harsanyi, in 'Morality and the Theory of Rational Behaviour' (1982), contends that Rawls' parties should assume an equal probability of being any member in society. Given sympathetic identification with each person's interests, they should choose (as if they were following) the principle of average utility (see UTILITARIANISM). But Harsanyi's ideal chooser, although ignorant of their own identity, still has full knowledge of everyone's desires and situations; Harsanyi views such knowledge as necessary for sympathetic identification. But Rawls' parties are without knowledge of anyone's desires and circumstances, and thus are rendered incapable of sympathetic identification, as well as making interpersonal comparisons of utility. Rawls also finds that, especially under conditions of radical uncertainty, gambling freedom to practise one's conscientious convictions against added resources betrays a failure to understand what it is to have a conception of the good. For these and other reasons Rawls contends that it is difficult to see how the argument for average utility can arise from his original position. More important, assuming publicity of basic principles, a utilitarian society will not command the willing allegiance of everyone (especially those made worse off), and so will not evince stability (see §3). That basic political principles be publicly known is required by democratic freedom; otherwise citizens are under illusions about the bases of their social relations and are manipulated by forces placed beyond their control. With Rawls' liberal egalitarian principles, nothing is, nor need be, hidden from public view in order to maintain social stability.

2 Democratic institutions

For Rawls the role of democratic legislation is not to register citizens' unconstrained preferences and let majority preferences rule, but to advance the interests of all citizens, so that each has the status of equal citizen, is suitably independent and can freely pursue a good consistent with justice. The two principles of justice as fairness designate a common good that provides the end of democratic legislation. Ideally it should not be individual or group interests voting, but citizens and legislators, whose judgments are based on laws that best realize the common good of justice, as defined by the two principles. These principles imply a liberal constitution that specifies basic liberties immune from majority infringement. The first principle also requires maintaining the fair value of each citizen's political rights, thereby establishing a limit on inequalities in wealth allowable by the difference principle. The second principle, the 'difference principle', preserves the 'fair value' of the remaining basic liberties. It suggests a criterion for deciding the basic minimum of resources each citizen needs to fairly and effectively exercise the basic liberties: property and economic institutions are to be so designed that those least advantaged have resources exceeding what the worst off would acquire under any alternative economic scheme (consistent with the first principle). This implies (depending on historical conditions) either a property-owning democracy (with widespread private ownership of the means of production) or liberal socialism. In either case, Rawls assumes markets are needed for efficient *allocation* of factors of production; but use of markets for *distribution* of output is constrained by the difference principle. Whatever effect redistributions from the market have on allocative efficiency is not a problem for Rawls, since justice has priority over efficiency. The end of justice is not to maximize productive output whatever the distributive effects, any more than it is to maximize aggregate utility (see JUSTICE §5).

3 Stability

The argument from the original position aims to show that justice as fairness best coheres with our considered judgments of justice (in 'reflective equilibrium'). But why should we care about justice enough to allow its requirements to outweigh our other aims? Stability addresses this issue of motivation. A conception of justice is 'stable' whenever departures from it call into play forces within a just system that tend to restore the arrangement. Unstable conceptions are utopian, not realistic possibilities. HOBBES argued that stability required a nearly absolute sovereign. This is incompatible with Rawls' democratic aim. To argue that justice as fairness is stable, Rawls appeals to principles of moral psychology to show how citizens in a 'well-ordered society' can acquire a settled disposition to act on and from the principles of justice. He then argues that justice as fairness is compatible with human nature, and is even 'congruent' with citizens' good in a society well ordered by justice as fairness.

A person's good is the plan of life they would rationally choose based on their considered interests from an informed position of 'deliberative rationality'. Rawls' congruence argument contends that it is rational, part of a person's good, to be just and reasonable for their own sake in a well-ordered society. Assuming citizens there have a sense of justice, it is instrumentally rational for them to cultivate this capacity by doing justice, in order to achieve the benefits of social cooperation. On the Kantian interpretation of justice as fairness, the capacity for justice is among the powers that define our nature as rational agents; by developing and exercising this power for its own sake, citizens realize their nature and achieve moral autonomy. The Aristotelian principle is a psychological law which implies that it is rational to want to develop the higher capacities implicit in one's nature. Since the circumstances of a well-ordered society describe optimal conditions for exercising one's sense of justice, it is rational to want to cultivate the virtue of justice for its own sake and achieve moral autonomy. Justice and moral autonomy are then intrinsic and supreme goods in a well-ordered society, so the Right and the Good are 'congruent'. If so, it is not rational to depart from justice, and a well-ordered society manifests inherent stability.

HEGEL argued that Rousseau's social contract, like Hobbes', was individualistic and incompatible with the values of community. Contemporary communitarians re-state Hegel's criticism, contending that Rawls' original position presupposes abstract individualism, with a metaphysical conception of persons as essentially devoid of the final ends and commitments that constitute their identity (see COMMUNITY AND COMMUNITARIANISM). In *Political Liberalism* ([1993] 1996) Rawls contends that this is mistaken. In *A Theory of Justice* he presupposes, not a metaphysical conception of persons, but a practical account of the conditions of political agency, as grounded in the moral powers. Given congruence, maintaining justice and just institutions is the shared good that underwrites the values of community (or 'social union') among free and equal moral persons.

Rawls' Kantian congruence argument addresses the classical aim of showing how justice can be compatible with the human good. It is one of Rawls' most original contributions to moral philosophy. It also bears implications that led Rawls subsequently to revise his view.

4 Political liberalism

The problem with congruence is that it conflicts with the 'reasonable pluralism' of liberal societies, which should tolerate a wide range of religious, philosophical and moral views. The 'burdens of judgment' imply certain limitations on judgment, so that under free institutions we cannot expect agreement upon a comprehensive metaphysical, religious, or moral doctrine or conception of the good. But congruence implies that widespread acceptance of the intrinsic good of moral autonomy is a condition of liberal stability. By hypothesis, most conceptions of the good in a well-ordered society can endorse Rawls' principles of justice. The problem is, some may not accept the intrinsic goodness of moral autonomy. Teleological views, such as liberal Thomism or a reasonable utilitarianism, will gain adherents in a well-ordered society, and for these views justice and autonomy are at best but instrumental to the one rational and intrinsic good (the Vision of God, and aggregate or average utility, respectively). The incompatibility of congruence with reasonable pluralism then undermines Rawls' original argument for stability.

In *Political Liberalism* Rawls reformulates the justification of justice as fairness as a 'freestanding' political conception. He aims to provide a public justification for justice as fairness acceptable to all citizens of a well-ordered democracy. This requires an argument that is not grounded in Kant's or some other comprehensive ethical doctrine, but rather in certain fundamental intuitive ideas implicit in democratic culture. Rawls argues that the features of the original position can be construed as a 'procedural representation' of the idea of social cooperation among free and equal citizens implicit in a democracy. The principles of justice can then be represented as 'constructed' from a 'model

conception' of democratic citizens as free, equal and possessed of the two moral powers that enable them to participate in social cooperation. These principles are politically justified since they are presented, not as true, but as most reasonable; they fit best with the considered political convictions of justice shared by democratic citizens, at all levels of generality, in wide reflective equilibrium (see LIBERALISM §5).

To complete this freestanding political justification, however, Rawls needs an alternative stability argument, one that, unlike congruence, does not rely upon premises peculiar to Kant's moral philosophy. The idea of 'overlapping consensus' says that the conception of justice that is politically justified as reasonable on grounds of individuals' shared conception of themselves as democratic citizens, will also be judged most reasonable or true on independent grounds, specific to each of the reasonable comprehensive doctrines gaining adherents in a well-ordered society. For its own particular reasons, each comprehensive view (for example, Kantians, utilitarians, pluralists, and religions accepting a doctrine of free faith) can endorse justice as fairness as true or reasonable. Justice as fairness then has one public, but many non-public, justifications in a well-ordered society. Assuming an overlapping consensus of reasonable comprehensive views exists there, justice as fairness evinces willing compliance, and hence stability.

REALISM AND ANTIREALISM

Introduction

The basic idea of realism is that the kinds of thing which exist, and what they are like, are independent of us and the way in which we find out about them; antirealism denies this. Most people find it natural to be realists with respect to physical facts: how many planets there are in the solar system does not depend on how many we think there are, or would like there to be, or how we investigate them; likewise, whether electrons exist or not depends on the facts, not on which theory we favour. However, it seems natural to be antirealist about humour: something's being funny is very much a matter of whether we find it funny, and the idea that something might really be funny even though nobody ever felt any inclination to laugh at it seems barely comprehensible. The saying that 'beauty is in the eye of the beholder' is a popular expression of antirealism in aesthetics. An obviously controversial example is that of moral values; some maintain that they are real (or 'objective'), others that they have no existence apart from human feelings and attitudes.

This traditional form of the distinction between realism and its opposite underwent changes during the 1970s and 1980s, largely due to Michael Dummett's proposal that realism and antirealism (the latter term being his own coinage) were more productively understood in terms of two opposed theories of meaning. Thus, a realist is one who would have us understand the meanings of sentences in terms of their truth-conditions (the situations that must obtain if they are to be true); an antirealist holds that those meanings are to be understood by reference to assertability-conditions (the circumstances under which we would be justified in asserting them).

1 Facets of the debate

Realism became a prominent topic in medieval times, when it was opposed to nominalism in the debate concerning whether universals were independent properties of things or if classification was just a matter of how people spoke or thought (see NOMINALISM). The impetus for the debate in modern times comes from Kant's doctrine that the familiar world is 'empirically real' but 'transcendentally ideal', that is to say a product of our ways of experiencing things, not a collection of things as they are 'in themselves' or independently of us. Kant's 'empirical realism', confusingly, is thus a form of antirealism (see KANT, I. §5).

Closely related is 'internal realism', as represented by Hilary PUTNAM, according to which something may be real from the standpoint marked out by a particular theoretical framework, while the attempt to ask whether it is real *tout court* without reference to any such framework is dismissed as nonsensical. This reaffirms the thesis propounded by Rudolf CARNAP, that there are 'internal' and 'external' questions about existence or reality. An internal question is asked by someone who has adopted a language of a certain structure and asks the question on that basis. Only philosophers attempt to ask external questions (are there really – independently of the way we speak – physical objects?). But this is either nonsense or a misleading way of asking whether our linguistic framework is well suited to our practical purposes. 'Internal realism', it should be noted, is certainly not a form of realism, since it admits only language- or theory-relative assertions of existence.

By the mid-1980s, largely as a result of the work of Putnam and DUMMETT, it had become common to formulate the distinction between realism and antirealism in a variety of what are *prima facie* quite different ways. A realist, it was said, thinks of truth in terms of correspondence with fact, whereas an antirealist defines truth 'in epistemic terms', for instance as 'what a well-conducted investigation under ideal circumstances would lead us to believe'. A realist holds that there are, or could be, 'recognition-transcendent facts', whereas an antirealist denies this. Also present was the idea that an antirealist believes that there can be a 'reductive analysis' (see §2 below) of whatever subject matter their antirealism relates to, whereas a realist holds such analysis to be impossible. Seemingly still further from the origins of the distinction, it was said to be characteristic of realism to accept, and of antirealism to deny, the general validity of the law of excluded middle. Yet another version located the basic difference in the respective theories of meaning: a realist gave the meaning of a sentence by specifying its truth-conditions, an antirealist by specifying the conditions under which it could properly be asserted.

To come to terms with this debate, the reader therefore needs an awareness of the interrelations of the many definitions of the realism–antirealism distinction, and of the inexactness of fit between some of them and others.

2 Ontological realism/antirealism

The primary form of the definition deals directly in terms of what really exists. A realist about Xs, for example, maintains that Xs (or facts or states of affairs involving them) exist independently of how anyone thinks or feels about them; whereas an antirealist holds that they are so dependent. We are not speaking here of causal (in)dependence: the fact that there would be no houses if people had not had certain thoughts should not force us into antirealism about houses. So the point of the definition is better brought out by saying that *what it is for an X to exist* does not involve any such factors (whatever their causal role in the production of Xs may be). Nor does the definition entail an antirealist stance towards the mental. Realism about mental states is a *prima facie* plausible option, holding that our mental states are what they are whatever we think they are, or whatever we would come to think they were if we investigated.

Where philosophers have argued for realism about some particular subject matter (for example, universals, ethical value, the entities of scientific theory), one particular argument is repeatedly found. For the subject matter in question, it is claimed, we find that everyone's opinion is the same, or tends to become the same if they investigate, or that (in science) theory seems to 'converge', later theories appearing to account for the partial success of their predecessors. Why should this be, unless it is the effect of a reality independent of us, our opinions and our theorizing? (See UNIVERSALS; SCIENTIFIC REALISM AND ANTIREALISM.)

In consequence, there are two broad antirealist strategies, both common. One is to argue that the supposed conformity of opinion, actual or potential, does not exist – so we hear of the diversity of ethical or aesthetic judgements, for instance, or the extent to which judgements of colour depend on viewing conditions and the state of the observer. The other is to accept the conformity, but explain it as arising from a uniformity of *our* nature rather than the independent nature of things. Thus it is argued that moral 'objectivity' is really 'inter-subjectivity' – that is, a result of shared human psychological responses rather than of independent moral properties in the world – or that the similarity between different languages' schemes of classification is a product of shared basic human interests, not something forced on us by 'real' universals.

In modern times nobody has made a more radical use of this method of explaining conformity of judgement in terms of intersubjectivity than Kant. He argued that even the experience of our environment as extended in space and time was a human reaction to things that were in themselves not of a spatiotemporal nature, and to which other beings might just as legitimately react altogether differently. In the face of this it may be felt that the argument from conformity is better used to establish a very abstract realism, namely that there must be

something independent of us, rather than that any specific property or type of thing must be so.

Two other objections have been used against certain forms of realism. One is that the realist provides no account of how the supposed real things or properties can actually have an effect on our experience. What sense do we have, it is asked, that is affected by the ethical properties of the moral realist, or by the real properties of necessity and possibility that the modal realist posits? The common realist practice of speaking of 'intuition' in these contexts is rejected as providing only a word, not an answer. The second type of objection (christened the 'argument from queerness' by John Mackie, who used it in the moral context) claims that the things or properties in which the realist believes would need to be too strange to be credible (see MORAL REALISM).

A closely related definition of the realism–antirealism distinction focuses not on the independence of things but on the truth of judgements about them: realism takes truth to be correspondence with fact and our knowledge of truth to be a separate matter, whereas antirealism defines truth 'in epistemic terms', that is to say as what human beings would believe after the best possible application of their cognitive faculties. This is much more a change of perspective than of substance. It is natural to think that if some object exists independently of us, then judging truly must consist in getting our judgement to match the way the object is; while if the object is determined by (perhaps a projection of) our cognitive and/or affective faculties, judging truly can only mean judging as those very faculties lead us to judge.

Harder to assess is the position of *reductive analysis* in the debate. A reductive analysis exists where what makes statements about one kind of thing, *A*, true or false are the facts about another kind *B*. (*A*s are then said to be reducible to *B*s.) Classically, phenomenalism claims that statements about physical objects are thus reducible to statements about sensory experiences; behaviourism holds that propositions about mental states are reducible to ones about dispositions to physical behaviour. Does accepting such a reduction mean accepting antirealism about the *A*s, while rejecting reduction of *A*-statements means accepting realism? Some philosophers speak in this way, and there is a clear point to doing so: if a reduction is possible, then a complete statement of everything there 'really is' would not need to mention *A*s – it could speak of *B*s instead. Besides, reductive analyses have usually been offered in opposition to a different conception of what *A*s are, and in relation to *that* (rejected) conception of an *A* the reducer is certainly saying that there are no *A*s. But it is not thereby said that *A*s and facts about them are dependent upon us – only that they are really certain sorts of fact about *B*s; our attitude to their independence is therefore a question of whatever we think about the latter (see REDUCTION, PROBLEMS OF).

3 Epistemological versions

It is common to hear realism characterized in terms of the limits of knowledge as the belief that there are, or could be, 'recognition-transcendent facts' (meaning thereby facts which lie beyond *our* cognitive powers – there is no intention to saddle the realist with the view that there may be facts which simply could not be recognized at all). Antirealism then becomes the view that no such facts are possible.

The motivation for this epistemic version of the realism–antirealism divide is not hard to see. If the way something is is independent of the way we are, what could rule out the possibility that there should be facts about it beyond our powers of knowledge? Conversely, if its whole nature is due to the way we 'construct' it through our style of experience and investigation, how could there be anything about it that our cognitive faculties cannot recover? Although understandable, this is quick and imprecise. Consider someone who holds that the nature of the physical world is utterly independent of what human beings may believe it to be, but also has such anthropocentric theological inclinations as to hold that God must have given us cognitive powers equal, in principle, to discovering every fact about it. If we call this philosopher an antirealist on these grounds, we have surely changed the original subject, not just drawn it from another perspective.

This brings out the significance of formulating the epistemic criterion in terms of mere possibility (there *could be* recognition-transcendent facts) rather than actuality, thus allowing the philosopher who thinks, for whatever reason, that our cognitive powers are in fact a match for reality, still to be a realist by virtue of accepting that our powers might have been more limited without reality being any different.

It is one thing to suggest that there may be facts beyond our powers of recognition, quite another to hold that this is true of certain specific facts; the former is just modesty about our cognitive capacities, the latter a positive scepticism. So to imply an intrinsic connection between realism and scepticism, as some do, is very different from identifying realism with a belief in the possibility of recognition-transcendent facts.

Again, there is a plausible line of thought linking realism closely to scepticism. If a certain type of fact is as it is quite independently of us, then our

knowledge of it must depend on an intermediary, namely the effect that it has upon us. But then we encounter the sceptical argument of which Descartes' fiction of a malicious demon represents the classic formulation: how are we ever to know that this intermediary effect is produced by the sort of thing we think it is produced by, and not rather by something completely different? Hence, starting with realism, we arrive at scepticism.

However, it seems undesirable to use scepticism (and the absence of it) to characterize the realism–antirealism distinction. The classic argument from realism (as independence of the subject) to scepticism may be a formidable one, but it nevertheless involves substantial assumptions which can be challenged; to adopt terminology which makes it sound as if its conclusion were true by definition invites confusion. Besides, scepticism is not itself a precise notion, and there may be forms of it which apply even under certain antirealist conceptions. For instance, one who thinks that truth is to be understood as the opinion that would be reached under ideal conditions may still be a sceptic, because they remain sceptical of our ability to recognize ideal conditions or know how closely we have approximated to them.

4 Logical and semantic versions

It is often said that realism and antirealism can be distinguished by their attitude towards the law of excluded middle (the logical principle that, given two propositions one of which is the negation of the other, one of them must be true): the realist accepts it, the antirealist does not. Again, we can understand this if we think back to the original characterization of the distinction in terms of what is independently there and what we 'construct', what is the case 'in itself' and what is so because of our ways of experiencing (see INTUITIONISTIC LOGIC AND ANTIREALISM).

For explanatory purposes we may consider the world of literary fiction. Most people will be happy enough with the idea that, in so far as anything can be said to be true of the world of Macbeth, just those things are true which Shakespeare wrote into it. But in that case neither 'Lady Macbeth had two children' nor its negation 'Lady Macbeth did not have two children' is true, since Shakespeare's text (we may suppose) does not touch on that question; the law of excluded middle fails in this 'constructed' world.

Passing now to a genuinely disputed case, there are those who think that whether a mathematical statement is true is one thing, whether it can be proved quite another; and there are those who think that truth in mathematics can only mean provability. For the latter the law of excluded middle is unsafe. From the fact that not-*p* cannot be proved, it does not follow that *p* can be proved; perhaps neither is provable and hence, on this view of mathematical truth, perhaps neither is true. And anyone who equates truth, in whatever sphere, with verifiability-in-principle by us will be liable to the parallel conclusion: only for those propositions *p* where failure to refute *p* is *ipso facto* to verify *p* may we rely on the law of excluded middle. Where verifying *p* and verifying not-*p* are distinct procedures, excluded middle fails. (It is because they are characteristically distinct when the proposition in question makes some claim about an infinite totality that we hear so much about infinite totalities and the rejection of excluded middle.) This explains why some writers (in particular Dummett) often say that the difference between realist and antirealist lies in the difference between their conceptions of truth.

It can also be seen why it should have become common to express the realism–antirealism opposition as an opposition between theories of meaning, and why philosophers should be found speaking of realist and antirealist semantics. Any theory which ties meaning to verification, which equates the understanding of a sentence with a knowledge of those conditions that would verify it or would justify us in asserting it, promotes the view that we have no other idea of what it is for it to be true than for these conditions to be satisfied. Hence the realism–antirealism debate often exhibits neo-verificationist features; sometimes (especially by Dummett) antirealism is presented as the outcome of Wittgensteinian ideas about meaning, sometimes (especially by Putnam) of the alleged impossibility of explaining how our language could ever come to refer to the mind-independent items that realism posits (see MEANING AND VERIFICATION).

REASONS AND CAUSES

Imagine being told that someone is doing something for a reason. Perhaps they are reading a spy novel, and we are told that their reason for doing so is that they desire to read something exciting and believe that spy novels are indeed exciting. We then have an explanation of the agent's action in terms of the person's reasons. Those who believe that reasons are causes think that such explanations have two important features. First, they enable us to make sense of what happens. Reading a spy novel is the rational thing for an agent to do if they have that particular desire and belief. Second, such explanations tell us about the causal origins of what happens. They tell us that the desires and beliefs that allow us to make sense of actions cause those actions as well.

The idea that reasons are causes has evident appeal. We ordinarily suppose that our reasons make a difference to what we do. In the case just described, for example, we ordinarily suppose that had the agent had appropriately different desires and beliefs then they would have acted differently: had the person desired to read something romantic instead of exciting, or had the person believed that spy novels are not exciting, a spy novel would not have been chosen. But if what they desire and believe makes a difference to what they do then the desires and beliefs that are those reasons must, it seems, be the cause of the person's actions.

Despite its evident appeal, however, the view that reasons are causes is not without its difficulties. These all arise because of the manifest differences between explanations in terms of reasons and causal explanations.

REDUCTION, PROBLEMS OF

Reduction is a procedure whereby a given domain of items (for example, objects, properties, concepts, laws, facts, theories, languages, and so on) is shown to be either absorbable into, or dispensable in favour of, another domain. When this happens, the one domain is said to be 'reduced' to the other. For example, it has been claimed that numbers can be reduced to sets (and hence number theory to set theory), that chemical properties like solubility in water or valence have been reduced to properties of molecules and atoms, and that laws of optics are reducible to principles of electromagnetic theory. When one speaks of 'reductionism', one has in mind a specific claim to the effect that a particular domain (for example, the mental) is reducible to another (for example, the biological, the computational). The expression is sometimes used to refer to a global thesis to the effect that all the special sciences, for example chemistry, biology, psychology, are reducible ultimately to fundamental physics. Such a view is also known as the doctrine of the 'unity of science'.

JAEGWON KIM

REDUCTIONISM IN THE PHILOSOPHY OF MIND

Reductionism in the philosophy of mind is one of the options available to those who think that humans and the human mind are part of the natural physical world. Reductionists seek to integrate the mind and mental phenomena – fear, pain, anger and the like – with the natural world by showing them to be natural phenomena. Their inspirations are the famous reductions of science: of the heat of gases to molecular motion, of lightning to electric discharge, of the gene to the DNA molecule and the like. Reductionists hope to show a similar relationship between mental kinds and neurophysiological kinds.

KIM STERELNY

REFERENCE

It is usual to think that referential relations hold between language and thoughts on one hand, and the world on the other. The most striking example of such a relation is the naming relation, which holds between the name 'Socrates' and the famous philosopher Socrates. Indeed, some philosophers in effect restrict the vague word 'reference' to the naming relation, or something similar. Others use

'reference' broadly (as it is used in this entry) to cover a range of semantically significant relations that hold between various sorts of terms and the world: between 'philosopher' and all philosophers, for example. Other words used for one or other of these relations include 'designation', 'denotation', 'signification', 'application' and 'satisfaction'.

Philosophers often are interested in reference because they take it to be the core of meaning. Thus, the fact that 'Socrates' refers to that famous philosopher is the core of the name's meaning and hence of its contribution to the meaning of any sentence – for example, 'Socrates is wise' – that contains the name. The name's referent contributes to the sentence's meaning by contributing to its truth-condition: 'Socrates is wise' is true if and only if the object referred to by 'Socrates' is wise.

The first question that arises about the reference of a term is: what does the term refer to? Sometimes the answer seems obvious – for example, 'Socrates' refers to the famous philosopher – although even the obvious answer has been denied on occasions. On other occasions, the answer is not obvious. Does 'wise' refer to the property wisdom, the set of wise things, or each and every wise thing? Clearly, answers to this should be influenced by one's ontology, or general view of what exists. Thus, a nominalist who thinks that properties do not really exist, and that talk of them is a mere manner of speaking, would not take 'wise' to refer to the property wisdom.

The central question about reference is: in virtue of what does a term have its reference? Answering this requires a theory that explains the term's relation to its referent. There has been a great surge of interest in theories of reference in this century.

What used to be the most popular theory about the reference of proper names arose from the views of Gottlob Frege and Bertrand Russell and became known as 'the description theory'. According to this theory, the meaning of a name is given by a definite description – an expression of the form 'the *F*' – that competent speakers associate with the name; thus, the meaning of 'Aristotle' might be given by 'the last great philosopher of antiquity'. So the answer to our central question would be that a name refers to a certain object because that object is picked out by the name's associated description.

Around 1970, several criticisms were made of the description theory by Saul Kripke and Keith Donnellan; in particular, they argued that a competent speaker usually does not have sufficient knowledge of the referent to associate a reference-determining description. Under their influence, many adopted 'the historical–causal theory' of names. According to this theory, a name refers to its bearer in virtue of standing in an appropriate causal relation to the bearer.

Description theories are popular also for words other than names. Similar responses were made to many of these theories in the 1970s. Thus, Kripke and Hilary Putnam rejected description theories of natural-kind terms like 'gold' and proposed historical–causal replacements.

Many other words (for example, adjectives, adverbs and verbs) seem to be referential. However we need not assume that all other words are. It seems preferable to see some words as syncategorematic, contributing structural elements rather than referents to the truth-conditions and meanings of sentences. Perhaps this is the right way to view words like 'not' and the quantifiers (like 'all', 'most' and 'few').

The referential roles of anaphoric (cross-referential) terms are intricate. These terms depend for their reference on other expressions in their verbal context. Sometimes they are what Peter Geach calls 'pronouns of laziness', going proxy for other expressions in the context; at other times they function like bound variables in logic. Geach's argument that every anaphoric term can be treated in one of these two ways was challenged by Gareth Evans.

Finally, there has been an interest in 'naturalizing' reference, explaining it in scientifically acceptable terms. Attempted explanations have appealed to one or more of three causal relations between words and the world: historical, reliable and teleological.

REICHENBACH, HANS (1891–1953)

Philosophy of science flourished in the twentieth century, partly as a result of extraordinary progress in the sciences themselves, but mainly because of the efforts of philosophers who were scientifically knowledgeable and who remained abreast of new scientific achievements. Hans Reichenbach was a pioneer in this philosophical development; he studied physics and mathematics in several of the great German scientific centres and later spent a number of years as a colleague of Einstein in Berlin. Early in his career he followed Kant, but later reacted against his philosophy, arguing that it was inconsistent with twentieth-century physics.

Reichenbach was not only a philosopher of science, but also a scientific philosopher. He insisted

that philosophy should adhere to the same standards of precision and rigour as the natural sciences. He unconditionally rejected speculative metaphysics and theology because their claims could not be substantiated either a priori, on the basis of logic and mathematics, or a posteriori, on the basis of sense-experience. In this respect he agreed with the logical positivists of the Vienna Circle, but because of other profound disagreements he was never actually a positivist. He was, instead, the leading member of the group of logical empiricists centred in Berlin.

Although his writings span many subjects Reichenbach is best known for his work in two main areas: induction and probability, and the philosophy of space and time. In the former he developed a theory of probability and induction that contained his answer to Hume's problem of the justification of induction. Because of his view that all our knowledge of the world is probabilistic, this work had fundamental epistemological significance. In philosophy of physics he offered epoch-making contributions to the foundations of the theory of relativity, undermining space and time as Kantian synthetic a priori categories.

WESLEY C. SALMON

REID, THOMAS (1710–96)

Thomas Reid, born at Strachan, Aberdeen, was the founder of the Scottish school of Common Sense philosophy. Educated at Marishal College, Aberdeen, he taught at King's College, Aberdeen until appointed professor of moral philosophy at Glasgow. He was the co-founder of the Aberdeen Philosophical Society or 'Wise Club', which counted among its members George Campbell, John Stewart, Alexander Gerard and James Beattie. His most noteworthy early work, *An Inquiry into the Human Mind: Or the Principles of Common Sense* attracted the attention of David Hume and secured him his professorship. Other important works are *Essays on the Intellectual Powers of Man* (1785) and *Essays on the Active Powers of the Human Mind* (1788).

Reid is not the first philosopher to appeal to common sense; Berkeley and Butler are notable British predecessors in this respect, in the discussions of perception and of free will respectively. It fell to Reid, however, to collect and systematize the deliverances of common sense – the first principles, upon the acceptance of which all justification depends – and to provide adequate criteria for that status. Reid insists we rightly rely on our admittedly fallible faculties of judgment, including the five senses, as well as memory, reason, the moral sense and taste, without need of justification. After all, we have no other resources for making judgments to call upon in justification of this reliance. We cannot dispense with our belief that we are continually existing and sometimes fully responsible agents, influenced by motives rather than overwhelmed by passions or appetites. In Reid's view major sceptical errors in philosophy arise from downgrading the five senses to mere inlets for mental images – ideas – of external objects, and from downgrading other faculties to mere capacities for having such images or for experiencing feelings. This variety of scepticism ultimately reduces everything to a swirl of mental images and feelings. However we no more conceive such images than perceive or remember them; and our discourse, even in the case of fiction, is not about them either. Names signify individuals or fictional characters rather than images of them; when I envisage a centaur it is an animal I envisage rather than the image of an animal. In particular the information our five senses provide in a direct or non-inferential manner is, certainly in the case of touch, about bodies in space.

Reid thus seems to be committed to the position that our individual perceptual judgments are first principles in spite of his admission that our perceptual faculties are fallible. Moreover, moral and aesthetic judgments cannot be mere expressions of feeling if they are to serve their purposes; a moral assessor is not a 'feeler'. Reid is therefore sure that there are first principles of morals, a view that scarcely fits the extent and degree of actual moral disagreement.

Reid offers alternative direct accounts of perception, conception, memory and moral and aesthetic judgment. He stoutly defends our status as continuing responsible agents, claiming that the only genuine causality is agency and that although natural regularities are held to be causes they cannot be full-blooded causes. Continuing persons are not reducible to material entities subject to laws of nature (pace Priestley); nor does the proper study of responsible agents belong within natural philosophy. Morals may be adequately systematized on a human rights basis according to which private property is not sacrosanct, once moral judgment is recognised to be based on first principles of morals. Judgments of beauty likewise rest on a body of first principles, even though Reid readily allows that there are no properties that all beautiful objects must have in common.

ROGER GALLIE

REINHOLD, KARL LEONHARD (1757–1823)

A catalyst in the rise of post-Kantian idealism, Reinhold popularized Kant's critical philosophy by systematizing it in the form of a theory of consciousness. Reinhold shifted from one position to another, however, each time declaring his latest philosophical creed as ultimate. For this he was ridiculed by his more famous contemporaries, including Fichte, Schelling and Hegel, and his historical reputation suffered accordingly. Recent re-evaluations, however, suggest that there was considerable coherence to his philosophical wanderings.

A sometime priest who converted to Protestantism, active freemason and popular teacher, Reinhold advocated political intervention in the promotion of enlightened practices. He steadfastly defended the French Revolution.

GEORGE DI GIOVANNI

RELATIVISM

Someone who holds that nothing is simply good, but only good *for someone* or from a certain point of view, holds a relativist view of goodness. Protagoras, with his dictum that 'man is the measure of all things', is often taken to be an early relativist. Quite common are relativism about aesthetic value, about truth in particular areas such as religious truth, and (arising from anthropological theory) about rationality. There are also a number of ways of answering the question 'relative to what?' Thus something might be said to be relative to the attitudes or faculties of each individual, or to a cultural group, or to a species. Relativism therefore has many varieties; some are very plausible, others verge on incoherence.

RELATIVITY THEORY, PHILOSOPHICAL SIGNIFICANCE OF

There are two parts to Albert Einstein's relativity theory, the special theory published in 1905 and the general theory published in its final mathematical form in 1915. The special theory is a direct development of the Galilean relativity principle in classical Newtonian mechanics. This principle affirms that Newton's laws of motion hold not just when the motion is described relative to a reference frame at rest in absolute space, but also relative to any reference frame in uniform translational motion relative to absolute space. The class of frames relative to which Newton's law of motion are valid are referred to as inertial frames. It follows that no mechanical experiment can tell us which frame is at absolute rest, only the *relative* motion of inertial frames is observable. The Galilean relativity principle does not hold for accelerated motion, and also it does not hold for electromagnetic phenomena, in particular the propagation of light waves as governed by Maxwell's equations. Einstein's special theory of relativity reformulated the mathematical transformations for space and time coordinates between inertial reference frames, replacing the Galilean transformations by the so-called Lorentz transformations (they had previously been discovered in an essentially different way by H.A. Lorentz in 1904) in such a way that electromagnetism satisfied the relativity principle. But the classical laws of mechanics no longer did so. Einstein next reformulated the laws of mechanics so as to make them conform to his new relativity principle. With Galilean relativity, spatial intervals, the simultaneity of events and temporal durations did not depend on the inertial frame, although, of course, velocities were frame-dependent. In Einstein's relativity the first three now become frame-dependent, or 'relativized' as we may express it, while for the fourth, namely velocity, there exists a unique velocity, that of the propagation of light *in vacuo*, whose magnitude c is invariant, that is, the same for all inertial frames. It can be argued that c also represents the maximum speed with which any causal process can be propagated. Moreover in Einstein's new mechanics inertial mass *m* becomes a relative notion and is associated via the equation $m = E/c^2$ with any form of energy *E*. Reciprocally inertial mass can be understood as equivalent to a corresponding energy mc^2.

In the general theory Einstein ostensibly sought to extend the relativity principle to accelerated motions of the reference frame by employing an equivalence principle which claimed that it was impossible to distinguish observationally between the presence of a gravitational field and the acceleration of a reference frame. Einstein here elevated into a fundamental principle the known but apparently accidental numerical equality of the inertial and the gravitational mass of a body (which accounts for the fact that bodies move with the same acceleration in a gravitational field, independent of their inertial mass). By extending the discussion to gravitational fields which could be locally, but not globally, transformed away by a change of reference frame, Einstein was led to a new theory of gravitation, modifying Newton's theory of gravitation, which could explain a number of

observed phenomena for which the Newtonian theory was inadequate. This involved a law (Einstein's field equations) relating the distribution of matter in spacetime to geometrical features of spacetime associated with its curvature, considered as a four-dimensional manifold. The path of an (uncharged spinless) particle moving freely in the curved spacetime was a geodesic (the generalized analogue in a curved manifold of a straight line in a flat manifold).

Einstein's theories have important repercussions for philosophical views on the nature of space and time, and their relation to issues of causality and cosmology, which are still the subject of debate.

MICHAEL REDHEAD

RELEVANCE LOGIC AND ENTAILMENT

'Relevance logic' came into being in the late 1950s, inspired by Wilhelm Ackermann, who rejected certain formulas of the form A→B on the grounds that 'the truth of A has nothing to do with the question whether there is a logical connection between B and A'.

The central idea of relevance logic is to give an account of logical consequence, or entailment, for which a connection of relevance between premises and conclusion is a necessary condition. In both classical and intuitionistic logic, this condition is missing, as is highlighted by the validity in those logics of the 'spread law', A→B; a contradiction 'spreads' to every proposition, and simple inconsistency is equivalent to absolute inconsistency. In relevance logic the spread law fails, and the simple inconsistency of a theory (that a set of formulas entails a contradiction) is distinguished from absolute inconsistency (or triviality: that a set of formulas entails every proposition). The programme of relevance logic is to characterize a logic, or a range of logics, satisfying the relevance condition, and to study theories based on such logics, such as relevant arithmetic and relevant set theory.

See SCEPTICISM

RELIGION AND MORALITY

The relationship between religion and morality has been of special and long-standing concern to philosophers. Not only is there much overlap between the two areas, but how to understand their proper relationship is a question that has stimulated much debate. Of special interest in philosophical discussions has been the question of divine authority and the moral life. If there is a God, how are we to understand the moral status of his commands? Are there moral standards that even God must acknowledge? Or does God's commanding something *make* it morally binding? Secular thinkers have insisted that these questions pose a serious dilemma for any religiously based ethic: either the moral standards are independent of God's will, with the result that God's authority is not supreme, or God's will is arbitrary, which means that what appears to be a morality is really a worship of brute power. Many religious ethicists have refused to acknowledge the dilemma, arguing for an understanding of divine moral directives as expressions of the complexities and excellences of God's abiding attributes.

The impact of religion on moral selfhood has also been much disputed. Secularists of various stripes have insisted that religion is not conducive to moral maturity. Religious thinkers have responded by exploring the ways in which one's notion of moral maturity is shaped by one's larger worldview. If we believe that there is a God who has provided us with important moral information, then this will influence the ways we understand what is to count as a 'mature' and 'rational' approach to moral decision making.

Religious ethicists have had a special interest in the ways in which worldviews shape our understandings of moral questions. This interest has been necessitated by the fact of diversity within religious communities. Different moral traditions coexist in Christianity, for example, corresponding to the rich diversity of theological perspectives and the plurality of cultural settings in which Christian beliefs have taken shape. This complexity has provided some resources for dealing with the 'postmodern' fascination with moral relativism and moral scepticism.

The relationship between religion and morality is also important for questions of practical moral decision. Religious ethical systems have often been developed with an eye to their 'preachability', which means that religious ethicists have a long record of attempting to relate theory to practice in moral discussion. The ability of a moral system to provide practical guidance is especially important during times of extensive moral confusion.

RICHARD J. MOUW

RELIGION AND SCIENCE

Philosophical discussion of the relation between modern science and religion has tended to focus on Christianity, because of its dominance in the West. The relations between science and Christianity have been too complex to be described by the 'warfare' model popularized by A.D. White and J.W. Draper.

An adequate account of the past two centuries requires a distinction between conservative and liberal positions. Conservative Christians tend to see theology and science as partially intersecting bodies of knowledge. God is revealed in 'two books': the Bible and nature. Ideally, science and theology ought to present a single, consistent account of reality; but in fact there have been instances where the results of science have (apparently) contradicted Scripture, in particular with regard to the age of the universe and the origin of the human species.

Liberals tend to see science and religion as complementary but non-interacting, as having concerns so different as to make conflict impossible. This approach can be traced to Immanuel Kant, who distinguished sharply between pure reason (science) and practical reason (morality). More recent versions contrast science, which deals with the what and how of the natural world, and religion, which deals with meaning, or contrast science and religion as employing distinct languages. However, since the 1960s a growing number of scholars with liberal theological leanings have taken an interest in science and have denied that the two disciplines can be isolated from one another. Topics within science that offer fruitful points for dialogue with theology include Big-Bang cosmology and its possible implications for the doctrine of creation, the 'fine-tuning' of the cosmological constants and the possible implications of this for design arguments, and evolution and genetics, with their implications for a new understanding of the human individual.

Perhaps of greater import are the indirect relations between science and theology. Newtonian physics fostered an understanding of the natural world as strictly determined by natural laws; this in turn had serious consequences for understanding divine action and human freedom. Twentieth-century developments such as quantum physics and chaos theory call for a revised view of causation. Advances in the philosophy of science in the second half of the twentieth century provide a much more sophisticated account of knowledge than was available earlier, and this has important implications for methods of argument in theology.

NANCEY MURPHY

RELIGION, PHILOSOPHY OF

Introduction

Philosophy of religion is philosophical reflection on religion. It is as old as philosophy itself and has been a standard part of Western philosophy in every period (see Religion, history of philosophy of). In the last half of the twentieth century, there has been a great growth of interest in it, and the range of topics philosophers of religion have considered has also expanded considerably.

Philosophy of religion is sometimes divided into philosophy of religion proper and philosophical theology. This distinction reflects the unease of an earlier period in analytic philosophy, during which philosophers felt that reflection on religion was philosophically respectable only if it confined itself to mere theism and abstracted from all particular religions; anything else was taken to be theology, not philosophy. But most philosophers now feel free to examine philosophically any aspect of religion, including doctrines or practices peculiar to individual religions. Not only are these doctrines and practices generally philosophically interesting in their own right, but often they also raise questions that are helpful for issues in other areas of philosophy. Reflection on the Christian notion of sanctification, for example, sheds light on certain contemporary debates over the nature of freedom of the will.

1 Philosophy and belief in God

As an examination of mere theism, the core of beliefs common to Western monotheisms, philosophy of religion raises and considers a number of questions. What would anything have to be like to count as God? Is it even possible for human beings to know God's attributes (see God, concepts of; Negative theology)? And if so, what are they? Traditionally, God has been taken to be a necessary being, who is characterized by omniscience, omnipotence, perfect goodness, immutability and eternity (see Omniscience; Omnipotence), who has freely created the world (see Freedom, divine), and who is somehow specially related to morality (see Religion and morality).

This conception of God takes God to be unique, unlike anything else in the world. Consequently, the question arises whether our language is capable of representing God. Some thinkers, such as Moses Maimonides, have argued that it is not and that terms applied to God and creatures are equivocal. Others have argued that our language can be made to apply to God, either because some terms can be used univocally of God and creatures, or because some terms used of creatures can be applied to God in an analogical sense.

Not everyone accepts the traditional characterization of God, of course. Pantheists, for example, reject the distinction between God and creation (see PANTHEISM). Certain philosophers have objected to the traditional conception on the grounds that it leaves certain philosophical problems, such as the problem of evil, insoluble (see PROCESS THEISM). And many feminists reject it as patriarchal.

Given the traditional conception of God, can we know by reason that such a God exists? There are certain arguments that have been proposed to demonstrate the existence of God so understood (see GOD, ARGUMENTS FOR THE EXISTENCE OF; NATURAL THEOLOGY). The ontological argument tries to show that a perfect being must exist (see ANSELM OF CANTERBURY). The cosmological argument argues that the existence of the world demonstrates the existence of a transcendent cause of the world. And the teleological argument argues from design in nature to the existence of a designer. Some philosophers have maintained that the widespread phenomenon of religious experience also constitutes an argument for the existence of a supernatural object of such experience. Most contemporary philosophers regard these arguments as unsuccessful (see ATHEISM; AGNOSTICISM).

But what exactly is the relation between reason and religious belief? Do we need arguments? Or is faith without argument rational? What is faith? Is it opposed to reason? Some philosophers have argued that any belief not based on evidence is defective or even culpable. This position is not much in favour any more. On the other hand, some contemporary philosophers have suggested that evidence of any sort is unnecessary for religious belief. This position is also controversial (see FAITH; RELIGION AND EPISTEMOLOGY).

Some philosophers have supposed that these questions are obviated by the problem of evil (see EVIL, PROBLEM OF), which constitutes an argument against God's existence. In their view, God and evil cannot coexist, or at any rate the existence of evil in this world is evidence which disconfirms the existence of God. In response to this challenge to religious belief, some philosophers have held that religious belief can be defended only by a theodicy, an attempt to give a morally sufficient reason for God's allowing evil to exist. Others have thought that religious belief can be defended without a theodicy, by showing the weaknesses in the versions of the argument from evil against God's existence. Finally, some thinkers have argued that only a practical and political approach is the right response to evil in the world.

Those who use the existence of evil to argue against the existence of God assume that God, if he existed, could and should intervene in the natural order of the world. Not everyone accepts this view (see DEISM). But supposing it is right, how should we understand God's intervention? Does he providentially intervene to guide the world to certain ends? Would an act of divine intervention count as a miracle? What is a miracle, and is it ever rational to believe that a miracle has occurred (see MIRACLES)? Some people have supposed that a belief that miracles occur is incompatible with or undermined by a recognition of the success of science. Many people also think that certain widely accepted scientific views cast doubt on particular religious beliefs (see RELIGION AND SCIENCE).

2 *Philosophy and religious doctrines and practices*

In addition to the issues raised by the traditional conception of God, there are others raised by doctrines common to the Western monotheisms. These include the view that the existence of a human being does not end with the death of the body but continues in an afterlife (see SOUL, NATURE AND IMMORTALITY OF THE). Although there is wide variation in beliefs about the nature of the afterlife, typically the afterlife is taken to include heaven and hell. For some groups of Christians, it also includes limbo and purgatory. All of these doctrines raise an array of philosophical questions (see HEAVEN; HELL; LIMBO; PURGATORY).

There is equally great variation in views on what it takes for a human being to be accepted into heaven. Christians generally suppose that faith is a necessary, if not a sufficient, requirement. But they also suppose that faith is efficacious in this way because of the suffering and death of Jesus Christ (see TRINITY). Christians take sin to be an obstacle to union with God and life in heaven, and they suppose that Christ's atonement is the solution to this problem (see SIN). Because of Christ's atonement, divine forgiveness and mercy are available to human beings who are willing to accept it. Most Christians have supposed that this willingness is itself a gift of God, but some have supposed that human beings unassisted by grace are able to will or even to do what is good (see PELAGIANISM). How to interpret these doctrines, or whether they can even be given a consistent interpretation, has been the subject of philosophical discussion.

The religious life is characterized not only by religious belief and experience but by many other things as well. For many believers, ritual and prayer structure religious life. Christians also suppose that sacraments are important, although Protestants and Catholics differ on the nature and number of the sacraments. For Christians, the heart of the religious life, made possible by the atonement and the believer's acceptance of grace, consists in the theological virtues – faith, hope, and charity.

Many religious believers suppose they know that these and other things are essential to the religious life because God has revealed them (see REVELATION). This revelation includes or is incorporated in a book, the Qur'an for Muslims, the Hebrew Bible for Jews, and the Old and New Testaments for Christians. How the texts in this book are to be understood and the way in which religious texts are to be interpreted raise a host of philosophical issues.

Certain thinkers who are not themselves philosophers are none the less important for the philosophy of religion. These include, for example, John CALVIN and Martin LUTHER, whose views on such issues as justification and atonement significantly influenced the understanding of these notions, and Jacques Maritain and Pierre Teilhard de Chardin, whose influence on contemporary philosophical theology has been significant.

RENAISSANCE PHILOSOPHY

Introduction

The term 'Renaissance' means rebirth, and was originally used to designate a rebirth of the arts and literature that began in mid-fourteenth century Italy (see HUMANISM, RENAISSANCE). Here the term is simply used to refer to the period from 1400 to 1600, but there are ways in which Renaissance philosophy can be seen as a rebirth, for it encompasses the rediscovery of Plato and Neoplatonism (see PLATONISM, RENAISSANCE), the revival of such ancient systems as Stoicism and scepticism (see STOICISM), and a renewed interest in magic and the occult. Continuity with the Middle Ages is equally important. Despite the attacks of humanists and Platonists, Aristotelianism predominated throughout the Renaissance, and many philosophers continued to work within the scholastic tradition.

1 Historical and social factors

Three historical events were of particular importance. First is the Turkish advance, culminating in the capture of Constantinople in 1453. This advance produced a migration of Greek scholars (like George of Trebizond) and Greek texts into the Latin-speaking West (see HUMANISM, RENAISSANCE; PLATONISM, RENAISSANCE). It also led to a search for new trade routes. The European discovery of the Americas and the first voyages to China and Japan widened intellectual horizons through an awareness of new languages, religions and cultures. New issues of colonialism, slavery and the rights of non-Christian peoples had an impact on legal and political philosophy (see VITORIA, F. DE; SUÁREZ, F.). The study of mathematics and science (especially astronomy) was also affected by developments in navigation, trade and banking, by new technology such as the telescope and other instruments (see KEPLER, J.; GALILEI, GALILEO), as well as by the recovery of Greek mathematics and the favourable attitude of Plato towards mathematical studies.

Second is the development of printing in the mid-fifteenth century. This allowed for the publication of scholarly text editions, for the expansion of learning beyond the universities, and for the increased use of vernacular languages for written material (see HUMANISM, RENAISSANCE §4). These changes particularly affected women, who were most often literate only in the vernacular. CHRISTINE DE PIZAN, PARACELSUS, RAMUS, MONTAIGNE, BRUNO and Charron are among those who used vernacular languages in at least some of their works.

Third is the Protestant reformation in the first part of the sixteenth century (see LUTHER, M.; CALVIN, J.). Protestant insistence on Bible reading in the vernacular strengthened both the use of the vernacular and the spread of literacy (see MELANCHTHON, P.). The Catholic Counter-Reformation also affected education, particularly through the work of the Jesuit Order (founded 1540), which set up educational institutions throughout Europe, including the Collegio Romano in Rome (founded 1553) and the secondary school at La Flèche, where DESCARTES was educated. Political philosophy took new directions (see HOOKER, R., for example) and theological studies changed. As the Protestants abandoned the *Sentences* of Peter LOMBARD and emphasized the church fathers, so the Catholics replaced the *Sentences* with the *Summa theologiae* of Thomas AQUINAS. In turn, these changes affected the undergraduate curriculum, which (for other reasons as well) became less technically demanding, especially in relation to logic studies. Personal liberties, too, were affected. Both Catholics and Protestants censored undesirable views, and the first Roman Catholic Index of Prohibited Books was drawn up in 1559. BRUNO was burnt for heresy, CAMPANELLA was imprisoned and the philosophical atheism of VANINI led to his execution. Calls for tolerance by such men as MONTAIGNE and LIPSIUS were not always favourably received. The books of all these men, and others such as ERASMUS, MACHIAVELLI and Rabelais, were placed on the Index or required to be revised. At the same time, Calvinist Geneva prohibited the printing of Thomas AQUINAS and Rabelais.

Social factors also affected philosophy which, as an academic discipline, was tied to the universities. These continued to accept only male students, and to teach in Latin, the universal language of learning and of the Roman Catholic Church, but more students came from higher social classes than during the Middle Ages. They expected a curriculum with less emphasis on technical logic and natural science and more on rhetoric, modern languages, history and other practical disciplines. Such curricular changes owed much to humanism, as did the spread of new secondary schools (see HUMANISM, RENAISSANCE; MONTAIGNE, M. DE).

The Renaissance was also notable for the spread of learning outside the university. Some men largely relied on the patronage of nobles, princes and popes (among them Valla, FICINO, PICO DELLA MIRANDOLA and ERASMUS), some were medical practitioners (including PARACELSUS and Cardano), some had private resources (like MONTAIGNE). Nor was it only men that were involved: CHRISTINE DE PIZAN, for example, was a court poet (see FEMINISM §2).

Jewish thinkers, too, were active outside the university (see JEWISH PHILOSOPHY §3). Yohanan ben Isaac see Alemanno and Judah ben Isaac Abravanel (known as Leone Ebreo) are particularly important figures of the Italian Renaissance.

2 Humanism and the recovery of ancient texts

Humanism was primarily a cultural and educational programme (see HUMANISM, RENAISSANCE; ERASMUS, D.; MORE, T.). Humanists were very much concerned with classical scholarship, especially the study of Greek, and with the imitation of classical models. Despite their frequent criticisms of scholastic jargon and techniques, they were not direct rivals of scholastic philosophers, except in so far as changes to the university curriculum brought about by the influence of humanist ideals diluted or squeezed out scholastic subjects. It was humanism that led to the rediscovery of classical texts, and their dissemination in printed form, in Greek and in Latin translation. Plato is the most notable example, but he was rediscovered with the Neoplatonists, and was often read through Neoplatonic eyes (see FICINO, M.; PLATONISM, RENAISSANCE). The so-called ancient wisdom of Hermeticism (also known as HERMETISM) was also recaptured within a Neoplatonic framework (see FICINO, M.), and, along with the Kabbalah (see KABBALAH), led to a revived interest in magic and the occult (see ALCHEMY; AGRIPPA VON NETTESHEIM, H.C.; BRUNO, G.; PARACELSUS). These streams also fed into the new vitalistic philosophy of nature (in such thinkers as PARACELSUS, BRUNO, CAMPANELLA, Cardano and Telesio). Other ancient schools of thought that were revived include Epicureanism, scepticism (see AGRIPPA VON NETTESHEIM, H.C.; ERASMUS, D.; SANCHES, F.; MONTAIGNE, M. DE) and Stoicism.

Some humanists wrote important works on education, including the education of women (see ERASMUS, D.). The Lutheran Aristotelian MELANCHTHON was also an educational reformer; and the Jesuits drew up the *Ratio Studiorum* (Plan of Studies) which prescribed texts for all Jesuit institutions. Humanism also affected Bible studies (see ERASMUS, D.; LUTHER, M.; HUMANISM, RENAISSANCE) and Aristotelianism itself.

3 Scholasticism and Aristotle

Scholastic philosophy was the philosophy of the schools, the philosophy which was taught in institutions of higher learning, whether the secular universities or the institutions of religious orders. The association of late scholastic philosophy with

institutions of higher learning carried with it a certain method of presentation, one which is both highly organized and argumentative, with a clear account of views for and against a given thesis. It also carried with it a focus on Aristotle, for it was Aristotle who provided most of the basic textbooks in the sixteenth- and even the seventeenth-century university. Nor was the study of Aristotle necessarily carried on in a rigidly traditional manner, for many different Aristotelianisms were developed. Moreover, particularly within the Jesuit order, there was a strong inclination to include new developments in mathematics and astronomy within the framework of Aristotelian natural philosophy.

Aristotelians include Paul of Venice, George of Trebizond, Vernia, Nifo, POMPONAZZI, MELANCHTHON, Zabarella and the Thomists (see below). Anti-Aristotelians include Petrarch, Blasius of Parma, Valla, RAMUS, SANCHES, Telesio, Patrizi da Cherso and CAMPANELLA. Some philosophers sought to reconcile Platonism and Aristotelianism (see PICO DELLA MIRANDOLA, G.; PLATONISM, RENAISSANCE).

A very important characteristic of late scholastic philosophy is its use of medieval terminology, along with its continued, explicit, concern both with problems stemming from medieval philosophy and with medieval philosophers themselves. There are fashions here as elsewhere. Albertism (the philosophy of ALBERT THE GREAT) was important in the fifteenth century; nominalism more or less disappeared after a final flowering in the early sixteenth century. Scotism declined significantly, but was still present in the seventeenth century. Thomism underwent a strong revival especially through the work of the Dominicans (Capreolus, Cajetan, Silvestri, VITORIA, Soto, Báñez and John of St Thomas) and the Jesuits (Fonseca, Toletus, SUÁREZ and Rubio: see THOMISM).

4 Philosophical themes

It is difficult to map the interests of Renaissance philosophers on to the interests of contemporary philosophers, especially as the main form of writing remained the commentary, whether on Aristotle or Aquinas. SUÁREZ is the first well-known author to write a major systematic work of metaphysics that is not a commentary, though earlier authors (such as Nifo and POMPONAZZI) had written shorter works on particular themes. Nonetheless, certain general themes can be isolated:

4.1 Logic and language. Logic was basic to the curriculum of all educational institutions, and many Renaissance philosophers wrote on logic. Individual humanists who worked in this field include Valla (§4), Agricola, Vives; MELANCHTHON and RAMUS; individual scholastics include Soto, Toletus and Fonseca. Theories of logic and language were often closely related to metaphysics and philosophy of mind, as well as to science.

4.2 Metaphysics and philosophy of mind. Among the themes that overlapped with theories of logic and language were: (i) mental language (see LANGUAGE OF THOUGHT); (ii) analogy; (iii) objective and formal concepts (see SUÁREZ, F.); (iv) beings of reason (see JOHN OF ST THOMAS). A specifically Thomistic theme in metaphysics was the relation between essence and existence (see AQUINAS, T. §9; SUÁREZ, F.). Other metaphysical issues include: (i) universals (see SUÁREZ, F.); (ii) individuation (see SUÁREZ, F.); and (iii) the Great Chain of Being (see FICINO, M.; POMPONAZZI, P.; BRUNO, G.). Issues in the philosophy of mind included the existence of an agent sense and of intelligible species).

4.3 Immortality. The biggest single issue was the nature of the intellectual soul, whether it was immortal, and if so, whether its immortality could be proved (see FICINO, M.; POMPONAZZI, P.; SUÁREZ, F.; JOHN OF ST THOMAS; SOUL, NATURE AND IMMORTALITY OF THE).

4.4 Free will. Free will was a topic closely connected with the religious issues of grace, predestination and God's foreknowledge (see POMPONAZZI, P.; LUTHER, M.; ERASMUS, D.; CALVIN, J.; MOLINA, L. DE).

4.5 Science and philosophy of nature. The discussion of scientific method also overlaps with logic. Themes include: (i) traditional Aristotelian discussions about the object of natural philosophy (see JOHN OF ST THOMAS); (ii) anti-Aristotelian materialism; (iii) the new philosophies of nature which saw the universe as full of life (see PARACELSUS; BRUNO, G.; CAMPANELLA, T.) or as explicable in terms of light-metaphysics; (iv) tentative approaches to empiricism (see RAMUS, P.; SANCHES, F.). Finally, there are the thinkers who set science on a new path by using a combination of mathematical description and experiment (such as COPERNICUS, KEPLER and GALILEO).

4.6 Moral and political philosophy. Humanists were deeply concerned with moral and political philosophy (see HUMANISM, RENAISSANCE; ERASMUS, D.), as were Protestant reformers (see MELANCHTHON, P.; CALVIN, J.). Although the central focus remained on Aristotle, Epicurean moral philosophy was taken up by Valla and Stoic moral philosophy was also influential. Major political thinkers included MACHIAVELLI, VITORIA and BODIN. Many discussions of forms of government, the status of law, and the notion of a just war grew out of the Aristotelian–Thomistic tradition – prominent contributors to this tradition include CHRISTINE DE

Pizan, Vitoria, Soto, Toletus, Suárez, Molina and Hooker. Other significant types of Renaissance political philosophy include: (i) conciliarism (see Nicholas of Cusa); (ii) utopianism (see Utopianism; More, T.; Campanella, T.); (iii) neostoicism. (See also Political philosophy, history of; Natural law.)

4.7 The human being. Themes related to the human being that were prominent in the Renaissance include: (i) the distinction between microcosm and macrocosm (Nicholas of Cusa; Pico della Mirandola, G.; Paracelsus; Campanella, T.); (ii) love (Ficino, M.; Pico della Mirandola, G.); (iii) the ability to shape one's own nature (Pico della Mirandola, G.; Pomponazzi, P.).

RENOUVIER, CHARLES BERNARD (1815–1903)

Charles Renouvier is the main representative of French Neo-Kantianism in the nineteenth century. Following Kant, he delimited the conditions for the legitimate exercise of the faculty of knowledge, and denounced the illusions of past metaphysics. Wishing to go further than Kant in this direction, he criticized the notions of substance and of actual infinity. According to him, relation is the basis of all our representations, reality is finite, and certainty rests on liberty. In ethics, he took into consideration, beyond the ideal of duty, the existence of the desires and interests to which history testifies.

REPRESENTATION, POLITICAL

Political representation – the designation of a small group of politically active citizens to serve as representatives of the political community as a whole – is a central feature of contemporary states, especially of those that claim to be democratic. But what does it mean to say that one person or one group of people represents a larger group? Representatives are sometimes understood as agents of those they represent, sometimes symbolizing them, sometimes typifying their distinctive qualities or attitudes. Although political representation has something in common with each of these, it has its own special character. The missing idea here may be that the group represented *authorizes* the representative to make decisions on its behalf. This still leaves open one crucial question, however: how far should political representatives remain answerable to those they represent, and how far should they have the freedom to act on their own judgment?

ANDREW REEVE

REPRODUCTION AND ETHICS

Introduction

The first reproductive issue debated extensively by philosophers was abortion. Debates about its morality were, and still are, dominated by the issue of the moral status of the foetus, on which a wide variety of views has been defended. The most 'conservative' view is usually associated with very restrictive abortion policies, inconsistent with 'a woman's right to choose' (though the connection has been challenged by Judith Jarvis Thomson). However, all but the most conservative find it hard to ground prevailing moral intuitions concerning the newer issue of using human embryos for research purposes. Embryos, and even gametes, also assume importance in the context of methods for overcoming infertility (artificial insemination by donor (AID), egg and embryo donation involving in vitro fertilization (IVF), surrogacy) where issues about rights and ownership may arise. Considerations of 'the welfare of the child', often used to settle surrogacy disputes, also bear on questions of

what should, or may, be done to avoid bringing a child with a genetic abnormality into the world. Current philosophical literature on reproductive issues is largely limited to a vocabulary of rights and little attention is paid to the social and familial contexts in which reproductive decisions are usually made

1 The status of the foetus

A wide range of views on the moral status of the foetus, and whether it is the sort of thing that may, or may not, be killed has been defended. (1) According to the 'conservative' position, the foetus has, from the moment of conception, the same moral status as an adult human being. (2) At the other, 'liberal', extreme, the foetus is claimed to be nothing but a collection of cells, part of the pregnant woman's body, like her appendix, until the moment of birth. Oddly enough, these diametrically opposed views share two assumptions; both assume that the moral status of the foetus remains unchanged from conception to birth and both assume that the foetus is, morally speaking, like something else – an adult or an appendix. Three other views reject at least one of these assumptions. (3) A 'moderate' view claims that the moral status changes at some determinate 'cut-off point' such as motility or viability. (4) According to the 'gradualist' view, the moral status changes gradually, increasing as the foetus develops. (5) According to the 'potentiality' view, the foetus has a unique moral status, being quite unlike anything else, that of a potential human being, from the moment of conception. Minor variations on these views exist, beyond the scope of the discussion presented here; however, a well-known sixth must be mentioned. (6) According to Michael Tooley and his followers, whatever the foetus is, it is not a person, that is, it does not have a right to life; and the same is true of infants (see RIGHTS).

Each of these views has been not only defended, but contested. None has an argument to establish what the moral status of the foetus is that its opponents regard as conclusive and each has difficulties concerning its *prima facie* consequences, which may be seized upon by opponents as unacceptable. So, for example, the potentiality view's 'difficulty' is that it hardly counts as yielding any consequences at all. The conservative view appears to yield the consequence that if you can save only a baby or a two-day-old embryo in vitro from certain death, you are faced with just the same moral dilemma as when you can save only one of two babies in cradles. Tooley's view, notoriously, licenses infanticide, and so on. The difficulties become even more acute when we come to consider the treatment of foetuses not *in utero*.

2 Embryonic and foetal research

The debate about the status of the foetus assumed prominence in the days when abortion came to be seen as an issue of women's rights, and this was well before we had acquired the technique of fertilizing extracted ova in vitro, or discovered that foetal brain tissue might help adult human beings suffering from Parkinson's disease, or started on the 'genome project' (see GENETICS AND ETHICS). The gradualist or moderate positions were, perhaps, gaining ground, as the views that underpinned the legislation governing abortion in many Western countries – wherein increasingly 'serious' reasons for abortion are required as the pregnancy develops but abortion 'on demand' is allowed in the first trimester – until the new questions about the treatment of first-trimester-age foetuses (or embryos) hit the headlines and people started manifesting qualms. In fact, research on quite well-developed – even viable – foetuses had been going on, but few people knew about it, and, in many countries, there was no legislation that covered it. Now there is, but the substantial restrictions laid down seem to fit badly with the policies which are fairly 'liberal' about first trimester abortions. If the moral status of a ten-week-old foetus is so minimal that abortion 'on demand' is morally permissible, why do we insist on laws restricting the use of even two- or three-day-old embryos for research? In particular, why is it always assumed (as it is) that embryos may only be used as a last resort (when, that is, no other animals can be used to further the research), a restriction that those concerned about our exploitation of other animals rightly point out calls for some justification (see ANIMALS AND ETHICS).

In fact, the debates about these issues tend to dodge questions about morality and centre instead around legislation where considerations of the general consequences of allowing or forbidding certain practices become obviously relevant. Hence *prima facie* inconsistent positions which combine liberal abortion legislation with very restrictive legislation on the use of embryos and foetuses may be defended on the grounds that, as things are at the moment, liberal abortion legislation is a necessary evil, the only available way of avoiding desperate

women resorting to backstreet abortionists or suffering the emotional and economic hardship of having babies they did not want and could not afford. However, this is hardly a defence that conservatives about the moral status of the foetus can employ; nor does it tend to recommend itself to those who defend 'a woman's right to choose'.

3 The right over one's own body

The prevailing emphasis on the status of the foetus has an odd effect; one could, if ignorant of the facts of human reproduction, read hundreds of articles written on abortion and be left wondering what they were. Those who maintain that, at least in the early stages, the foetus is just a growth in the woman's body, fail to mention the fact that it is a growth like no other, namely a growth that, uniquely, results from the cells of two human beings, and is a growth that will usually become a baby, someone's child, if allowed to develop. Those who hold the 'conservative' or 'potential' view emphasize the fact that a fertilized ovum naturally develops into a baby; some mention the fact that an ovum is fertilized by a male cell and that this usually happens as a result of sexual intercourse, but remarkably few mention the fact that the nine-month development into a baby standardly – and arduously – takes place in a woman's body. If one did not know better, one might reasonably infer that parthenogenesis was common and that many of the results of sexual intercourse were raised in incubators as in Aldous Huxley's *Brave New World*.

Conservatives about not only the status of the foetus, but also abortion, do not deny that we all have some sort of right over our own bodies; they merely claim that it is restricted, or outweighed, by the foetus' right to life. This initially plausible move has been challenged, however, in a deservedly famous article by Judith Jarvis Thomson, which, despite its age, still stands almost alone in its attempt to take account of what is special about abortion, namely that it is the termination of a (human) pregnancy. A human pregnancy, regardless of one's views about the status of the foetus, is a condition of a human body, and usually results from sexual intercourse, voluntary or involuntary, in the hope, or not, of conceiving. Thomson daringly allows the conservatives their premise about the moral status of the foetus and argues that, even if this is granted, the impermissibility of abortion does not follow in many cases. Her argument depends on the claim that the right to life does not, as such, include the right to the use of another person's body to survive. If you can survive only by being connected to my circulatory system for nine months, then my right to decide what happens to my body allows me not only to refuse and let you die, but, moreover, to disconnect us and thereby kill you if I have not granted you the right to use my body but have been kidnapped and connected up to you while unconscious.

The wild unlikelihood of the latter scenario reflects Thomson's heroic attempt to describe something that is not a pregnancy but is like at least unintended pregnancies in the (assumed) relevant respects, namely that one person (the foetus, granting the conservative view) needs the use of another person's body to survive, while the second person has not done anything that can be construed as giving them the right to use it. The strained nature of Thomson's analogies has attracted much criticism, but few of her critics have paused to reflect that any analogies to pregnancy are bound to be strained because there simply is not any other condition of the human body remotely like it.

Her article manages to take cognizance of remarkably many of the unique features of pregnancy but still leaves several out. When we turn from the issue of abortion to those of surrogacy, artificial insemination by donor (AID) and in vitro fertilization (IVF), the fact that a fertilized ovum has resulted from the cells of two human beings, a man and a woman, and the fact that it would become a baby, someone's child, if enabled and allowed to develop *in utero*, assume unavoidable prominence. Moreover, questions about what is involved in 'the right to decide what happens to my body' and, more generally, what counts as 'mine', become increasingly problematic.

4 Rights and ownership

AID, IVF and surrogacy, as moral and political issues, revolve around those people who very much want to have a child; hence the question of whether the foetus has the moral status of something that may be killed tends to fade into the background, and passionate feelings about parenthood, families and 'my (our) child' come to the foreground. Those who espouse the conservative view on the status of the foetus do indeed object to the current practice of IVF on the ground that it tends to involve producing 'spare' embryos, which must either be allowed to die or be frozen and stored; but the various methods of alleviating infertility involve many further problems.

Feminists have found themselves divided over what to say about surrogacy, inclined, on the one hand, to defend the view that a woman's right to decide what happens to her body surely extends to deciding whether or not to act as a surrogate mother but inclined, on the other, to liken surrogacy to female prostitution, regarding both as

practices in which the woman's body is *used* in an exploitative and degrading manner, even if she has, in some sense, freely consented.

Anyone who is, for whatever reason, inclined to defend at least some forms of surrogacy, has to consider what should be done when the agreement between the parties concerned breaks down – when, say, the surrogate mother changes her mind, and wants to keep the child, or the commissioning couple change theirs and do not want to take it. Some aim to settle these unhappy questions by arguing that surrogacy is a form of 'pre-natal adoption', whereby the commissioning couple acquire parental rights (and duties) to the embryo as soon as fertilization takes place; the surrogate mother cannot abort it, nor claim it, nor can the commissioning couple refuse to take it without this counting as their immorally abandoning it. Others aim to settle them by considering who owned the sperm and ovum involved initially, who can be said to have 'donated' or given up their rights to these gametes and who has retained them, whether the surrogate mother acquires a right to the baby by (in a new sense of the phrase) 'mixing her labour with it', and hence who 'owns' the baby, as though gametes, foetuses and children were like any other possessions. But, like the two most extreme positions on the moral status of the foetus, each of these approaches takes cognizance of only some of the facts relevant to human reproduction, ignoring those emphasized by the other side and leaving some out entirely.

5 Welfare considerations

What about, in particular, 'the welfare of the child', the consideration which, in practice, has pre-eminently been appealed to in resolving disputes when surrogacy agreements have broken down? This undoubtedly goes beyond the debates about the various adults' rights but it is not, thereby, a consideration independent of the facts that are appealed to in those debates. For, it may be said, it is in the best interests of any child not only to be wanted and loved by two adults, but also for its mother's love to spring from the natural bond that exists between the child and the mother who carries it and gives birth to it and, even further, for it to have the opportunity to know, and, we hope, love, its genetic parents. But these considerations resolve a surrogacy-agreement breakdown adequately (if that) only in the particular case in which the surrogate child is the genetic offspring of the surrogate mother and her partner and they decide mutually they want to keep the child. Otherwise, the decision has to be over the circumstances in which the child will be least disadvantaged.

That surrogacy and, indeed, AID, and egg and embryo donation are all methods of overcoming infertility that, arguably, lead to the production of a disadvantaged child probably forms the strongest basis for those who are morally opposed to them all. Common claims that they are all unnatural, or introduce a third party into what should be 'the exclusive relationship between wife and husband', thus undermining the family, tend to fall foul of the obvious counter that few things are more 'natural', or more affirmative of the value of family life, than a couple's desire to have a child. But no-one thinks that this natural, proper, and in some cases, quite consuming, desire can, morally, be satisfied by any means. You cannot steal a child in order to have one, and, it may be said, you cannot set about bringing a disadvantaged child into the world in order to have one either.

The extent to which different methods of overcoming infertility produce, or would produce, a disadvantaged child is usually thought to vary. As I write, many people in Britain have said that it would be a terrible thing for a child to know that its 'mother' was an aborted foetus and, on those grounds, supported legislation designed to forbid any future use of the ova already present in female foetuses. It is important to remember in cases such as these that the very existence of the child whose welfare would be at stake depends on the decision taken. The choice here, for example, is not between existence with a foetus as mother and existence without, but between existence with a foetus as mother and nonexistence. However, egg donation by mature women, embryo donation and AID, when uncomplicated by surrogacy, often pass unquestioned – though the recent discovery that an unscrupulous doctor at an infertility clinic in America was the genetic father of hundreds of children, having used his own sperm to fertilize all his patients, gave some people pause for thought.

Considerations of what sort of life a child produced in certain circumstances will have may also form the basis of adverse moral judgments of people's selfishness and irresponsibility. Many condemned a fifty-nine-year-old woman who chose to have a child by IVF (though the same judgment is rarely passed on even older men who father children), and some insist that people carrying certain genes should get themselves sterilized and resign themselves to childlessness or adoption. It is sometimes even said that it is selfish and irresponsible of pregnant women to reject screening for genetic abnormality or to reject abortion when it is identified; but whether this is so surely depends on their reasons for the rejections. If they think, for instance, that the genetic abnormality does not prevent one's life being a good one (perhaps because

they or their partner have it themselves), or if they think that abortion, at least in their circumstances, is wrong, then they have a good reason for not trying to 'maximize happiness' on this occasion (see UTILITARIANISM).

6 Morality, legislation and rights

At this point we return to the abortion debate, but now under a new aspect and in a way that brings questions about infanticide more clearly to the fore. The most fundamental objection to the conservative position on the status of the foetus is that it puts abortion, at any stage, on a par with infanticide, and, in the usual context of the abortion debate, infanticide equals murder; on the conservative view, abortion in the case of rape is not one whit more justifiable than murdering a child conceived through rape, and arguably less justifiable or excusable (given the innocence of the child) than the woman murdering the rapist. But in the context of euthanasia, killing an infant, or allowing it to die, without its consent, may well not be counted as murder, even on a conservative view; not because, quite generally, infants fail to be 'persons' with a right to life, who can thereby be killed for any old reason (as Tooley suggests), but because, when a human being is by virtue of extreme youth (or perhaps extreme impairment) incapable of autonomy, 'paternalistic' considerations of their welfare form, quite properly, the determining factor (see LIFE AND DEATH).

So even on the conservative view on the status of the foetus, abortion in the form of 'foetal euthanasia' may be justified, as infant euthanasia may be; and on any view that ranks the foetus as somehow not quite the same as a born baby, the possibilities of justification increase. But a new twist has been added; 'euthanasia' has its motivation built in, since it is done for the sake of the one who dies. Morally speaking, there is all the difference in the world between seeking an abortion because one wants a 'designer baby', and seeking it because one thinks it is wrong to bring a disadvantaged child into the world, just as there is a difference between my instructing the doctors to take my mother off life support for her sake, and my doing it to save myself the medical bills. But, given that people can and will lie about their motives, there is no way in which legislation can effectively permit the well-motivated cases but prohibit the callous ones.

Much of the literature devoted to reproductive ethics in fact vacillates between discussing morality and legislation, frequently leaving it unclear which is at issue. This is, no doubt, in part the result of the current tendency to talk almost exclusively in terms of rights, for we tend to think of (moral) rights as things that should be protected by good legislation. But we too readily forget that, particularly within families, it may be morally quite wrong for me to exercise a right that I certainly have, and, more generally, that there is much opportunity within families for acting morally well or ill where questions of rights, and even duties, do not arise. Most reproductive decisions are made by couples who love each other, who discuss what 'their' decision will be; the discussion is often extended to other members of the family who will say 'we' decided; most of the couples want to be good parents, and morally good people. This is, indeed, how things should mostly be, but none of it can be brought about by legislation, and all of it is almost universally ignored in the current literature (see FAMILY, ETHICS AND THE).

REPUBLICANISM

Significant divisions exist in all societies and communities of any size. The expression of these divisions in politics takes many forms, one of them republican. The hallmark of republican politics is the subordination of different interests to the common weal, or what is in the interest of all citizens. To ensure this outcome, government in a republic can never be the exclusive preserve of one interest or social order; it must always be controlled jointly by representatives of all major groups in a society. The degree of control exercised by representatives of different social elements may not be equal, and different styles of government are compatible with republican objectives. However, all republican governments involve power-sharing in some way. Even in a democratic republic political majorities must share power with minorities for the common good to be realized.

Maintaining an appropriate balance of political power is the chief problem of republicans. One or another faction may obtain control of government and use it to further its own interests, instead of the common weal. To prevent this republicans have

developed a variety of strategies. Some rely on constitutional 'checks and balances' to cure the mischief of factionalism. Others seek to minimize factionalization itself by regulating the causes of faction – for example, the distribution of land and other forms of property. Still others promote civic religions in order to bind diverse people together. All these methods accept the inevitability of conflicting interests, and see the need to accommodate them politically. Hence, civic life is at the heart of republicanism.

RUSSELL L. HANSON

RESPONSIBILITY

To be responsible for something is to be answerable for it. We have *prospective* responsibilities, things it is up to us to attend to: these may attach to particular roles (the responsibilities of, for instance, parents or doctors), or be responsibilities we have as moral agents, or as human beings. We have *retrospective* responsibilities, for what we have done or failed to do, for the effects of our actions or omissions. Such responsibilities are often (but not always) moral or legal responsibilities.

The scope of our retrospective moral responsibilities is controversial. We are responsible for the intended results of our actions, but how far we are responsible for their foreseen effects, or for harms that we do not prevent when we could, depends on how we should define our prospective responsibilities, that is, on how far we should regard such foreseen effects, or such preventable harms, as our business. To say that I am responsible for some foreseen effect, or for a harm which I did not prevent, is to say that I should have attended to that effect or to that harm in deciding how to act; our retrospective responsibilities are partly determined by our prospective responsibilities.

I am responsible for something only if it is within my control. It is sometimes argued that I am therefore not responsible for that whose occurrence is a matter of luck; but it is not clear that we can or should try to make responsibility wholly independent of matters of luck.

We have responsibilities not merely as individuals, but also as members of organizations (organizations themselves have responsibilities in so far as they can be seen as agents). This raises the question of how far we are responsible for the actions of groups or organizations to which we belong.

REVELATION

All major theistic religions have claimed that God has revealed himself in some way, both by showing something of himself in events and also by providing some true, important and otherwise unknowable propositions. Event-revelation may include both general revelation (God revealing himself in very general events, observable by all, such as the existence of the universe and its conformity to natural laws), and special revelation (God revealing himself in certain particular historical events). The events are a revelation in the sense that God has brought them about and they show something of his character. Thus Judaism teaches that God manifested his nature and his love for Israel when he brought his people out of Egypt and led them to the promised land through the agency of Moses. Christianity traditionally affirms that God has revealed himself in a much fuller sense in Jesus Christ – because Jesus did not merely show us something of the character of God but was God himself. God reveals propositions by some chosen prophet or society telling us truths orally or in writing which we would not have adequate grounds for believing unless they had been announced to us by persons who showed some mark of God-given authority. Thus Islam teaches that God inspired Muhammad to write the Qur'an in the seventh century AD, and that its success (its proclamation throughout a large part of the civilized world), content and style (deep thoughts expressed in a beautiful way, not to be expected of an uneducated person) show its divine origin.

REVOLUTION

There have been revolutions in politics, science, philosophy and most other spheres of human life. Here we discuss revolution mainly through concepts pertaining especially to the political realm. Attempts to define political revolution have been controversial; as a consequence there is dispute about whether specific occurrences were revolutions, rebellions, *coups d'état* or reformations.

If we define revolution as the illegal introduction of a radically new situation and order for the sake of obtaining or increasing individual or communal freedom, we may list those characteristics most often ascribed to it. These characteristics distinguish it from its earlier use where revolution referred to the return of an original state of affairs, as in astronomy; they also allow its distinction from related concepts such as reformation. At least at a superficial level this definition can do justice to early

modern (seventeenth and eighteenth) as well as late modern (nineteenth and twentieth century) revolutions. Through these periods there has, however, been sufficient change in concepts closely related to revolution to require the definition's openness to nuances for it to apply to both periods. It is unclear whether even such a nuanced definition can apply in postmodern thought.

PETER A. SCHOULS

RHETORIC

Rhetoric is the power to persuade, especially about political or public affairs. Sometimes philosophy has defined itself in opposition to rhetoric – Plato invented the term 'rhetoric' so that philosophy could define itself by contrast, and distinctions like that between persuasion and knowledge have been popular ever since. Sometimes philosophy has used rhetorical techniques or materials to advance its own projects. Some of its techniques, especially topics of invention, the classification of issues, and tropes or figures of speech, are occasionally employed by philosophers. The philosophical question is whether these techniques have any interest beyond efficacy. What is the relation between techniques effective in persuading others and methods for making up one's own mind? Is there any connection between the most persuasive case and the best decision? Is there a relation between the judgments of appropriateness and decorum exercised by the rhetorician, and the judgments of appropriateness exercised by the person of practical wisdom? Do judgments about probability, ambiguity and uncertainty, and judgments under constraints of time or the need for decision, aspire to the ideal of perfect rationality, to which they are doomed to fall short, or do these kinds of judgment have an integrity of their own? Apart from supplying useful techniques, an art of persuasion also raises philosophic questions concerning the relation between rhetoric and logic, rhetoric and ethics, and rhetoric and poetics.

EUGENE GARVER

RICKERT, H.

See Neo-Kantianism

RICOEUR, PAUL (1913–)

Paul Ricoeur is one of the leading French philosophers of the second half of the twentieth century. Along with the German philosopher Hans-Georg Gadamer, Ricoeur is one of the main contemporary exponents of philosophical hermeneutics: that is, of a philosophical orientation which places particular emphasis on the nature and role of interpretation. While his early work was strongly influenced by Husserl's phenomenology, he became increasingly concerned with problems of interpretation and developed – partly through detailed inquiries into psychoanalysis and structuralism – a distinctive hermeneutical theory. In his later writings Ricoeur explores the nature of metaphor and narrative, which are viewed as ways of creating new meaning in language.

JOHN B. THOMPSON

RIGHT AND GOOD

'Right' and 'good' are the two basic terms of moral evaluation. In general, something is 'right' if it is morally obligatory, whereas it is morally 'good' if it is worth having or doing and enhances the life of those who possess it.

Acts are often held to be morally right or wrong in respect of the action performed, but morally good or bad in virtue of their motive: it is right to help a person in distress, but good to do so from a sense of duty or sympathy, since no one can supposedly be obliged to do something (such as acting with a certain motive) which cannot be done at will.

Henry Sidgwick distinguished between two basic conceptions of morality. The 'attractive' conception, favoured by the ancient Greeks, views the good as fundamental, and grounds the claims of morality in the self-perfection to which we naturally aspire. The 'imperative' conception, preferred in the modern era, views the right as fundamental, and holds that we are subject to certain obligations whatever our wants or desires.

CHARLES LARMORE

RIGHTS

Introduction

There is widespread consensus that rights are ways of acting or of being treated that are beneficial to the rightholder. Controversy begins, however, when one attempts to specify the notion of rights further.

(1) It is sometimes said, perhaps too casually, that all rights carry with them correlated obligations –

things that other persons are supposed to do or refrain from doing when some given person is said to have a right to something. The question is: how is it best to state this relationship between rights and correlated obligations?

(2) Most people think that rights are, in some sense, justified. But there is considerable controversy as to what, precisely, is the proper focus of justification. Some say that rights are practices (certain ways of acting or of being treated) that are established, typically socially established. Thus, the issue for them is whether the fact of social recognition and enforcement is justified (or could be). Others say that rights themselves are claims; hence a right is a justified claim or principle of some sort (whether the practice identified in that claim exists or not). This dispute, between rights as justified practices and rights as justified claims, needs to be explored and, if possible, resolved.

Other topics need addressing beyond the question of the initial characterization of rights. One of them is the question of the function of rights: What good are they anyway? What can one do with rights? Another is the question of how best to justify particular kinds of rights, such as human rights and basic constitutional rights. Is there a substantive theory of critical morality that can do the job? Many people are concerned, especially, with whether utilitarianism (one of the dominant ethical theories in the West today) is up to this task. Finally, mention should be made of one other issue much talked about of late: what kinds of beings can have rights, and under what conditions of possession and dispossession?

1 Initial characterization and some points of consensus

Rights are an important issue in contemporary social and political philosophy. For it is widely held that rights, by providing a significant protection of important interests of individuals against the state and against other persons (even a majority), give a person something to stand on. One may not want to go so far as to say that rights are 'trumps' (as some have), but it is none the less clear that rights are valuable things. So it seems natural to ask: 'what, then, is a right?'

Rights are socially established ways of acting or ways of being treated (or, alternatively, such ways as ought to be so established). More specifically, a right so understood is a right *to* something that is (1) fairly determinate and that (2) can be similarly distributed on an individual basis to each and all of those who are said to be rightholders. A right is always regarded as (3) a beneficial way of acting or of being treated both for the rightholder and, more generally, for society. Thus, (4) it is or should be something socially accepted – recognized and protected in given societies. Such acceptance would be (5) deemed reasonable, even by outsiders, in that it made explanatory sense. For the way of acting or of being treated in question could be exhibited, plausibly, as a means to or as a part of accomplishing some interest or perceived benefit or other good (or desirable) thing. Accordingly, (6) directives could be issued to others, to those who are not rightholders. And (7) further initiatives could be taken as a feature of any such successful claim to rights status.

This initial characterization constitutes common ground in the arguments people make about rights. Indeed, several of its features are not particularly controversial at all. Thus, there would today be widespread consensus on the idea that rights are ways of acting or ways of being treated that are (1) appropriately determinate, (2) equitably distributable on an individual basis and (3) beneficial. Even the central characterization, concerning social acceptability in (4), is not unduly contestable as stated; but dispute would break out as soon as we tried to determine what to emphasize – whether rights are *socially established* or merely *ought* to be. Finally, the idea (6) that rights always involve some sort of normative direction of the behaviour of others might also appear to be universally agreed upon; but there are problems with alleging consensus on this particular point.

2 Normative direction

The view in question in (6) is often put by saying that rights correlate with duties – meaning thereby that a right always implies or has attached some distinctive and closely related duty of others. But serious difficulties arise for the thesis in this precise form.

The most interesting arguments against such correlations derive from Wesley Hohfeld's highly influential classification of rights (see Hohfeld, W.N.). On his view a legal right could be constituted by any one of four elements: a claim; a liberty; a power; or an immunity. And each type of right has a unique second-party correlative. Thus, for a legal *claim right* to some thing the correlative

element is a legal duty of some second party. Analogously, a person's *immunity right* from some thing is necessarily correlated with a lack of power – with a legal disability – on the part of others to do that thing (for example, the constitutional inability of the US Congress to 'abridge' free political speech). Hohfeld's point is simply that a legal duty and a no-power (a legal *in*ability) are significantly different. Accordingly, the existence of immunity rights tells against the view that the correlative of every right is always going to be a closely related second-party duty.

Thus, the thesis that rights logically correlate with specific duties is not sound. A weaker but more defensible view is that any genuine right must involve some normative direction of the behaviour of persons other than the holder. Even this weaker thesis, however, seems to run up against the authority of Hobbes (in his account of rights in the state of nature) and of Hohfeld. We can see this most clearly by looking at the Hohfeldian liberty right.

Here the legal *liberty right* to do some thing – which consists in the absence of any duty on the agent's part to refrain from doing that thing – is matched with other people's lack of a claim that such a thing not be done by the agent. The point is, this is the *only* directive incumbent on the conduct of second parties in the case of a liberty. They can make no claim on the duties of a liberty-rightholder (to refrain); beyond that their own action is relatively unencumbered.

A liberty right, so conceived, is indeed an odd one. For it fails to capture the common-sense notion that when one has a liberty right to do a thing someone else is directed not to interfere with that doing. The problem is that literally *no* normative direction at all is involved for second parties (in Hobbes' case) and no *significant* normative direction against interference is involved (in Hohfeld's).

If the common-sense notion of a liberty right is correct, there ought always to be some sort of strong mandate for non-interference, either explicitly stated in our formulation of a given liberty or present at least in the context in which that liberty normally occurs. Thus, to take the latter case, certain standing duties of second parties (such as the duty not to assault or batter others or to trespass on their property), even though these are relatively independent of a given liberty (for example, the liberty to paint one's barn a shocking purple), would none the less afford the exercise of that liberty a considerable degree of protection. Without some such fairly robust mandates against interference (either closely connected to the liberty in question or permanently and independently in place on the 'perimeter' of its usual exercise), we would probably be inclined to call that liberty, not a right, but a *mere* liberty or a privilege.

The upshot, then, is that we should state our main contention so as to emphasize *significant* normative direction (on the conduct of second parties). This is the focal point of what appears to be an emerging consensus on the matter at issue.

3 Accreditation

No real consensus has emerged, however, on the point we now turn to: whether rights, in order to be rights, require social recognition (and beyond that, social maintenance). In considering this issue one school of thought – embracing both classical natural rights theorists and contemporary advocates of human rights – has tended to emphasize that individuals can have rights independently of organized society, of social institutions, and hence of social recognition and maintenance in any form. The rather common characterization that rights are essentially claims can be taken as a way of emphasizing that rights hold irrespective of whether they have been acknowledged, either in the society or, more specifically, by that person against whom the claim is made.

Against the view that rights are essentially claims are ranged a number of philosophers. Bentham comes most readily to mind, and his polemic on this very point against natural rights as 'nonsense' still adds relish to philosophical discussions. T.H. Green, in his insistence that rights require social recognition and that without it they are something less than rights, would be another. And, oddly enough, Lenin would be a third.

The problem we are examining arises, in part, because the procedure for deciding whether something is a right is not wholly settled. We find that the vocabulary of rights, in particular, of human rights, may actually be used at any of several steps: that of mere claim, that of entitlement (where only the claim-to element is really settled), that of fully validated claim (where we have the idea both of a justified claim *to* something and of a justified claim *against* someone for it) and, finally, that of satisfied or enforced claim (where the appropriate measures required to support or to fulfil the claim have been given effective embodiment as well). The presence of these possible stages has introduced a degree of ambiguity into assertions that a right exists.

Accordingly, we find a significant variety of contemporary opinion as to the point at which such assertions can most plausibly be thought to take hold. While some have said simply that rights are *claims*, others say they are *entitlements*, and yet others (most notably, Feinberg 1973) say they are *valid claims*. Ranged against them have been those (such

as Sumner 1987) who emphasize that rights, even human rights, are basically established ways of acting or being treated. And, last of all, some have treated rights as legitimate expectations and, hence, have landed more or less in the middle (see RAWLS, J.).

The main backdrop to the view that rights are (valid) claims is, I think, the common opinion (emphasized by Dworkin, Raz, MacCormick and Held among others) that to have a right is to have a justification for acting in a certain way, or a justification for being treated in a certain way (see DWORKIN, R.). Now, suppose that a candidate for rights status had all the rights-making features (mentioned in §1) but one. Although accredited (in the sense of justified), it was not established; it lacked the *social* recognition which it ought to have.

Why should the lack of such recognition deprive it of rights status? For, clearly, if we modelled the rights-making features on what was justified (what was accredited in *that* sense), the thing was already a right even before it was recognized, even before it became a practice. And when it was recognized it would be recognized as a *right* (as something that was fully justified) and would not simply *become* a right in being recognized.

The opposing view, that rights are socially recognized practices, rests on three main contentions. The first of these is the contention that the notions of authoritative recognition (if not explicit, then at least implicit, as evidenced by conduct) and of governmental promotion and maintenance (usually on a wide variety of occasions) are themselves part of the standard notion of a *legal* right, that is, when we are concerned with rights that are more than merely nominal ones.

Thus, on the social recognition view, the fatal flaw in the theory of rights as valid claims (in any of its formulations) is the suggestion that practices of governmental recognition and enforcement in law can be dispensed with in the case of legal rights. Indeed, this is the very point at which both Dworkin and Raz, who might otherwise be taken to be supporters of some form of the valid claims thesis, desert that thesis for one that emphasizes the necessity of institutionally establishing ways of acting/being treated, if these are to count as *legal* rights.

The second point put forward by the social recognition view is that it is desirable to have, if possible, a single, unequivocal sense of 'rights': one that is capable of capturing both legal rights and human (and other moral) rights under a single generic heading. Now, if the argument just sketched is to be credited, then the view of rights as valid claims does not provide an adequate generalized notion of rights, one that can comfortably include both legal and human rights. For we have already seen that legal rights cannot be satisfactorily accounted for under the heading of valid claims.

This brings us to the third point urged by the social recognition view. Here the argument is that *all* moral rights can, indeed must, be construed as involving established practices of recognition and maintenance. Since human rights (as a special case of moral rights) are thought to be addressed to governments in particular, we must regard practices of governmental recognition and promotion as being the form for such recognition and maintenance to take for these rights. Here we have, in brief compass, then, the social recognition view that opposes the contention that rights are essentially justified or valid claims.

4 Functions of rights

Rights have many functions. Two in particular are emphasized in the contemporary literature: the conferring of liberty or autonomy (on rightholders) and the protection of their interests, especially their basic interests.

Rights in the seventeenth and eighteenth centuries were largely discussed as if they were simply liberties and, hence, ways of acting on the part of the rightholder. Indeed, this tendency is deeply rooted in the tradition of rights discourse. It is hard to say when 'a right' was first spoken of in a way continuous with current usage, but many careful expositors locate that first recognizable use with WILLIAM OF OCKHAM, when he talked of a right (*ius* or *jus*) as a power or capacity (*potestas*) to act in accordance with 'right reason' or, in the special case of a legal right (*ius fori*), with an agreement. Such a usage was well established by the seventeenth century (with Hobbes and, some would say, with Locke) and has been widespread ever since.

It constitutes, none the less, a drastic oversimplification – even if the rights referred to are, as they often are, the classic rights of the eighteenth-century declarations. For these rights include important rights to ways of being treated and such rights are *not* things the rightholder does or can do. Even so, the oversimplification continues to prevail in philosophical literature (for example, Rawls 1993). Thus, Rawls' 'equal basic liberties' (enshrined in his first principle of justice) include both liberties of action and ways of being treated, typically ways of not being injured by the actions of others (see FREEDOM AND LIBERTY §3).

It is clearly possible to have both important functions (the conferring of liberty on rightholders and the protection of their interests) as functions of rights, often of a single right. Thus it seems arbitrary, where both functions are normally served

by almost all rights, to single out just one of these functions (typically the function of conferring autonomy) and to give it *definitional* weight (see Sumner 1987).

In fact, in line with the contemporary understanding of rights (as expressed, for example, in the UN's *Universal Declaration of Human Rights* of 1948), it might be best to stress three main functions of rights. Thus, the central content of some rights will be a way of acting (for example, a liberty of conduct of some sort). But at the core of other rights will be a way of being treated: a non-injury of some sort or, alternatively, the provision of a service.

Corresponding to each main heading or class of rights (as determined by these central cores), there is an appropriate or characteristic normative response enjoined for the conduct of others. But the essential character of this normative direction of the conduct of second parties shifts from main case to main case. Allowing or even encouraging a piece of conduct is what these parties are normatively directed to do in the case of a liberty; prohibiting their doing of an injury to the rightholder or requiring of them a service, again to the rightholder, is the incumbent directive in the other two cases.

5 Critical justification

Rights are eminently plausible candidates for justification, an idea that I tried to capture with the notion that rights are *accredited* ways of acting or of being treated. This section will consider some of the main full-blown theories offered to justify rights. One proviso is that the most important rights are universal rights – in particular, human rights and constitutional rights, which are fundamental or basic civil rights of all persons (or all citizens) within a given politically organized society. My account is limited to theories that attempt to justify such universal rights.

All civil rights are important rights and all reflect a high level of social commitment. But not all can be justified as representing individuated and practicable and universal moral claims which serve as proper conclusions to sound arguments from objective principles of critical morality (or at least from principles widely regarded as reasonable).

Some can be, however. Indeed, in the social recognition view (described in §3), human rights would be, simply, constitutional rights that embodied precisely such morally valid claims. These claims, then, when on their own, could be described (relatively noncontroversially and giving due weight to both the opposing views canvassed in §3) as human rights *norms*.

We can ask: what might be involved, then, in the justification of human rights – or human rights norms – and of those constitutional rights susceptible of the same sort of justification? One thing seems clear: the norms which constitute or back up human rights are moral norms. Thus human rights can exist only if substantive moral norms in some sense exist (or, at least, can be objectively described and argued for). Now, it is possible for moral, and hence human, rights to exist even if moral norms are conventional or are relative to culture. But if human rights – or human rights norms – are to serve their role as international standards of political criticism then such a conventional morality would have to include some norms that are accepted worldwide. More important, if such norms are to have weight and bearing for future human beings in societies not yet existing (and this much would seem to be involved if we are to call these norms *universal* in any significant sense), then these norms cannot be merely conventional.

Thus, in classifying human rights as moral rights one may wish to distinguish between actual and critical moralities. What seems especially crucial to human rights, then, is the belief that there are objectively correct, or objectively reasonable, critical moral principles. Often, human rights – or human rights norms – are traced back to such foundational ideas as human dignity or moral personality or moral agency or moral community. But the exploration of such possibilities has failed to gain widespread support, perhaps because such notions as moral agency do not themselves seem sufficiently distinct from the very norms or rights they are being called upon to justify. Or perhaps because such notions seem, in the end, to stand in need of a more basic sort of justification themselves. Thus, we might do well to consider other grounding principles, principles that could be regarded as rock bottom and, arguably, as objectively reasonable.

One appropriate way to narrow the field among these is to consider first those substantive theories of critical justification that have grown up in proximity to serious talk about human and constitutional rights. Three important contemporary theories fit this description: utilitarianism (in particular, the theory developed by J.S. Mill (§10) and advocated recently under the name of 'indirect' utilitarianism), the theory of John Rawls, and rational-choice ethical theory, especially that of David Gauthier (see Contractarianism). I will confine the discussion to one example.

Rawls' theory (like Dworkin's) emphasizes the standing priority of basic liberties and other constitutional rights over such things as the common good or perfectionist values (for example, the value of holiness, as religiously conceived, or the values of Nietzschean elitism). In his 1993 book

Political Liberation Rawls sketches a complex theory of justification comprising two main parts. He starts with what he calls a 'freestanding' justification of the political conception of justice, drawing here on certain fundamental ideas which he finds 'implicit' in the contemporary democratic tradition. Next he claims that this political conception will also be endorsed and supported as the focus of an 'overlapping consensus' among the proponents of various comprehensive religious and moral doctrines that exist in the Western world today. Historic utilitarianism is prominently mentioned as one of these doctrines.

But it is doubtful that the utilitarian principle of general happiness could support the assignment of basic rights – constitutionally guaranteed benefits – to individuals if such rights prevented the utilitarian politician from allowing policies favourable to corporate or aggregate interests to override or supersede constitutional rights when those interests could be seen to conduce to greater benefit. In that sense, then, philosophical utilitarianism is incompatible with the notion of basic rights developed by Rawls, Dworkin and others. For utilitarianism cannot possibly accept a critical justification of a scheme of basic institutions in which constitutional civil rights have a standing priority over policies favouring corporate goods or aggregate welfare.

Much hinges, it would seem, then, on how discussion of the critical justification of rights is set up and conducted. And if questions regarding the distribution of rights are best taken up *after* successful or at least plausible attempts at justification, then such issues as what kinds of beings can have rights are seen to hang in the balance as well.

Currently, we find highly agitated discussions about whether foetuses have rights or whether animals can have them or about limits to the right to life (in cases of mercy killing, for example, or in requests for assisted suicide). But a serious attempt to give answers to questions such as these, questions of distribution and of scope and of defeasibility, cannot be clearly addressed until they can be considered in the light of adequate accounts of the function of rights and with one or more substantive theories of critical justification in hand (see Animals and ethics; Reproduction and ethics).

References and further reading

Feinberg, Joel (1973) *Social Philosophy*, Foundations of Philosophy Series. Englewood Cliffs, NJ: Prentice-Hall. (Referred to in §3. Feinberg is probably the leading US writer on the concept of rights; his argument that rights are valid claims has been especially influential. This book is intended for introductory reading by students in political studies. Chs 4–6 are relevant to rights.)

Rawls, John (1993) *Political Liberalism*, New York: Columbia University Press, 2nd edn (expanded), 1996. (Although Rawls here attempts a more conversational style, this book is ultimately no easier than his 1971 book, *Theory of Justice*. Here Rawls attempts to rework his theory of justice as a *political* theory. Also contains, unrevised, his important 1982 essay, 'The Basic Liberties and Their Priority'. Rawls's theory of critical justification is described and criticized in §5.)

Sumner, L. Wayne (1987) *The Moral Foundation of Rights*, Oxford: Oxford University Press. (This well-written book also represents one of the most important attempts to provide a critical justification of rights on a utilitarian basis.)

RISK ASSESSMENT

Probabilistic or quantitative risk assessment (QRA) aims to identify, estimate and evaluate a variety of threats to human health and safety. These threats arise primarily from particular technologies (such as commercial nuclear fission) or from environmental impacts (such as deforestation). Defined in terms of the probability that some consequence will occur, 'risk' typically is expressed as the average annual probability of fatality that a particular activity imposes on one individual. For example, because of normal lifetime exposure to dichloromethane (DCM), a multipurpose solvent, the average member of the public has an annual probability of dying from cancer of 0.0000041 or (4.1×10^{-6}). Or, for every million persons exposed to DCM throughout their lifetimes, on average the chemical will cause four cancer deaths each year.

Although risks may be *individual* (such as those from consuming saturated fats) or *societal* (such as those from liquified natural gas facilities), government typically regulates only societal risks. By definition, they are largely involuntarily imposed, whereas individual risks affect only the persons voluntarily choosing them. Most QRAs address societal risks, either because a government seeks a scientific basis for particular risk regulations, because some industry wishes to determine possible liability for its processes or products, or because actual or potential victims want to protect themselves or to allocate risks by means other than market mechanisms.

Philosophical contributions to QRA are of three main types: assessments of particular risks, criticisms of existing assessments, and clarifications of important QRA concepts, methods or theories. Such

contributions usually focus on either epistemology (including philosophy of science) or ethics. Epistemological analyses address, for example, the adequacy and appropriateness of some scientific, probabilistic or policy techniques used in QRA; the status of a specific causal hypothesis about risk; or the rationality of alternative decision rules for evaluating risks. Ethical analyses investigate, for instance, the equity of the risk distributions presupposed in a specific QRA or by general QRA methodology; the degree to which a particular method of risk evaluation accounts for crucial social values, such as free informed consent and due process; and the extent to which a given QRA technique, such as discounting the future, begs important ethical questions such as rights of future generations.

ROMAN LAW

Law was Rome's greatest gift to the intellect of modern Europe. Even today the Roman law library, and the achievements of the jurists who built it up, live on in the law of the Continental jurisdictions and of other countries farther afield. It is true that over the past two centuries codification has largely interrupted the long tradition of direct recourse to the Roman materials, but the concepts applied in civilian jurisdictions and the categories of legal thought which they use are still in large measure those of the Roman jurists. In England, perhaps for no better reason than that from the late thirteenth century the judges of the King's Bench and Common Pleas happened to come from a background which cut them off from the clerical education which had given their predecessors access to the Roman library, there was no reception of Roman law. Post-Norman England thus became the second Western society to set about building up a mature law library from scratch. The common law (being the law common to the whole realm of England) and the civil law (being the *ius civile*, the law pertaining to the *civis*, the citizen, initially of course the Roman citizen) thus became the two principal families within the Western legal tradition. It is wrong, however, to suppose that the development of the common law was constantly isolated. There have on the contrary been important points of contact at almost all periods. One result is that the categories of English legal thought are not in fact dissimilar to those of the jurisdictions of continental Europe. The study of Roman law has contributed immeasurably to the idea of a rational normative order, an idea fundamental to legal philosophy as indeed to all practical philosophy.

ROMAN STOICISM

See Stoicism

RORTY, RICHARD MCKAY (1931–)

Richard Rorty is a leading US philosopher and public intellectual, and the best-known contemporary advocate of pragmatism. Trained in both analytic and traditional philosophy, he has followed Dewey in attacking the views of knowledge, mind, language and culture that have made both approaches attractive, drawing on arguments and views of the history of philosophy from sources ranging from Heidegger and Derrida to Quine and Wilfrid Sellars. He takes pragmatism to have moved beyond Dewey by learning from analytical philosophy to make 'the linguistic turn', and from Thomas Kuhn that there is no such thing as 'scientific method'. Language and thought are tools for coping, not representations mirroring reality. Rorty's characteristic philosophical positions are what might be called 'anti-isms', positions defined primarily by what they deny. In epistemology he endorses anti-foundationalism, in philosophy of language anti-representationalism, in metaphysics anti-essentialism and anti- both realism *and* antirealism, in meta-ethics ironism. He extols pragmatism as the philosophy that can best clear the road for new ways of thinking which can be used to diminish suffering and to help us find out what we want and how to get it. In the public arena, he is a leading exponent of liberalism and critic of both left and right.

ROSMINI-SERBATI, ANTONIO (1797–1855)

In the reactionary, anti-Enlightenment, spiritualistic climate of Italy and Europe in the first decades of the nineteenth century, the Italian philosopher Rosmini set out to elaborate a Christian, Catholic system of philosophy which drew elements from Platonic, Augustinian and Thomist thought, while also taking account of recent philosophical developments, especially Kantian ones, as well as of the new liberal political trends in the culture of the

time. His aim was to restore the principle of objectivity in the field of gnoseology, as well as in ethics, law and political thought.

Translated from the Italian
by VIRGINIA COX

ROSS, WILLIAM DAVID (1877–1971)

W.D. Ross was a British ancient and moral philosopher. In terms of his moral thinking, he was a pluralist, who held that there are several distinct moral considerations which bear on the rightness of an action. Among the things we need to take into account are promises we have made, the need to avoid harming others, gratitude to benefactors, and the amount of good our action will produce. That these considerations are morally relevant is something we can know, but which action is the right one is a matter of fallible judgment, because that will depend upon how these considerations are to be weighed against each other in the particular case. Ross' contributions to the study of ancient philosophy mainly concerned Aristotle. He is now best known, however, for his moral philosophy.

DAVID MCNAUGHTON

ROUSSEAU, JEAN-JACQUES (1712–78)

Introduction

Rousseau was born in Geneva, the second son of Isaac Rousseau, watchmaker. His mother died a few days after his birth. From this obscure beginning he rose to become one of the best-known intellectual figures of the eighteenth-century French Enlightenment, taking his place alongside Diderot, Voltaire and others as one of the emblematic figures of this period, for all that he came to differ violently in view from them. He died in 1778 and in 1794 his body was transferred to the Panthéon in Paris.

Rousseau always maintained that he regretted taking up a career of letters. His first love was music and he composed a number of operas in the 1740s with some success. The turning point in his life occurred in July 1749. He was on his way to see his then friend Diderot who was imprisoned at Vincennes. He read in the newspaper a prize essay question, asking whether advances in the sciences and arts had improved morals. So overcome was he by the flood of ideas that this question aroused in him, he had to break his journey. The rest of his life's work was, he claimed, determined for him at that moment. Rousseau's primary claim to fame depends on his ideas about morals, politics and society. Perhaps his best-known remark is 'Man is born free; and everywhere he is in chains'; this reveals his preoccupation with issues of freedom in the state.

In answer to the prize essay question Rousseau argued that men and morals were corrupted and debilitated by advances in higher learning. The goal of prestigious distinction is substituted for that of doing useful work for the good of all. This theme, of people seeking invidious ascendancy by doing others down – the effect of exacerbated *amour-propre* – pervades Rousseau's social theorizing generally. His essay, *Discourse on the Sciences and Arts* (1750), won the prize; related concerns shape the more profound *Discourse on the Origin of Inequality* of 1755. In his most famous work of political theory, *The Social Contract* (1762), Rousseau presents an alternative approach to how we might achieve a just and legitimate civil order. All members of society should take an equal place as members of the sovereign authority and societal laws should come from the general will by which a people gives rules to itself. Only under such a system, Rousseau argues, will humankind live on equal terms bound by fraternal ties, enjoying as much freedom and rights of self-determination as is possible in a stable community. Speaking up in this way for the equal political standing of all, regardless of birth or wealth, Rousseau points the way towards the dissolution of the *ancien régime* and the emergence of more democratically based polities. Precisely what influence his ideas had on the French Revolution is impossible to determine, although his name was often invoked.

Rousseau also wrote extensively on education. In his *Émile* (subtitled *On Education*, 1762) he tries to show how a child could be brought up free of the aggressive desire to dominate others. Instead that child can be caused to want to cooperate with others on a footing of mutual respect. He hopes by this to show that his social proposals are not an unrealizable dream. In this work there are also criticisms of religious dogma and church practices which brought severe condemnation onto Rousseau. He had to flee Paris in 1762 to avoid imprisonment. This, and other related experiences, plunged him into a protracted period of mental distress in which he feared he was the object of the plotting of others. These others came to include David Hume, with whom Rousseau had hoped to find refuge in England in 1766.

Still troubled in mind, Rousseau returned to France the next year, and during the last decade of

his life he wrote several works of self-explanation and self-justification. The greatest of these is his autobiography, *Confessions* (written between 1764 and 1775, published posthumously), but there are other more prolix writings. After an accident in 1776, the worst of Rousseau's mental disturbance seems to have cleared and his last substantive work, an album of miscellaneous reflections on his life, ideas and experiences (*Reveries of the Solitary Walker*, written 1776–8), has a clarity and balance which had been absent for so long.

1 Life and writings

Brought up by his father for the first ten years of his life after the death of his mother, Rousseau traced his love of republican Rome to the reading of Plutarch that he and his father used to do. This love, along with the idolization of his native Geneva, provided the inspiration for many of his political ideas. After being involved in a fight, Rousseau's father fled Geneva in 1722 and Rousseau was sent to live with his cousin not far from Geneva for a couple of years. This period in his youth is exquisitely evoked by Rousseau in Book One of *Confessions* (1764–75). When he returned to Geneva his more lowly social station became apparent and he was indentured to an engraver, Abel Ducommun, a brutal and ill-educated man.

Restless and dissatisfied, Rousseau was more than glad to take advantage of the mischance of being locked out of the city on a Sunday in 1728. He walked away from that life, seeking the help of a Catholic priest who sent him to see Françoise-Louise de la Tour, Baronne de Warens, who was in receipt of money to secure more Catholic converts. She sent him, in turn, to Turin for instruction and Rousseau was admitted to the Church in April 1728. It is doubtful that Rousseau had any deep spiritual involvement in this process; he was more anxious to retain others' interest in him. He had a number of shortlived jobs in Turin. In one of these, he lied about stealing a ribbon and put the blame on a servant girl. This wicked deed preyed on his mind for the rest of his life.

The next year, he made his way back to Madame de Warens. He learned the rudiments of music and his passion for music was a dominant force in his life at this time. By the autumn of 1731 he had moved in permanently with Madame de Warens. They lived a life of innocent delight for some years, she calling him *petit* and he calling her *maman*. He became her lover in 1733, although he appears never to have enjoyed this almost incestuous relationship. He read avidly during this time, laying a foundation for many of his later writings.

This idyll did not endure, however. Rousseau was displaced in Madame de Warens's affections in 1738. Considerably aggrieved, he took up the post of tutor to the two sons of Jean Bonnot de Mably in Lyons in 1740. Not an adept teacher, he gave up the post after a year, determined to make his way in the larger world of Paris where he moved in 1742 (two short essays on education date from this time).

Once there, he presented a paper on musical notation to the Academy of Sciences; this was published in 1743 as *Dissertation on Modern Music*. In that year, Rousseau went to Venice as secretary to the French Ambassador. They quarrelled and Rousseau returned to Paris to resume his musical compositions. About this time he set up home with his mistress, Thérèse Levasseur, who was to be his lifelong companion. He had a number of children by her, whom he abandoned to his later shame. Rousseau had also begun to keep the company of the rising Parisian intelligensia. DIDEROT was a personal friend and it was while on the way to visit him during one of his periodic bouts of imprisonment that Rousseau had the experience that fixed the course of the rest of his life. The Academy at Dijon had advertised a prize essay question asking whether the advancements in the sciences and arts had improved morals. Rousseau saw this and was so overwhelmed by a flood of insights evoked by it that (he said) he spent the rest of his life trying to put into words what he had seen in one hour. Rousseau, answering the question with a firm 'No', won the prize and his essay was published in 1750 under the title *Discourse on the Sciences and Arts*. He was poised to begin a new career as social critic, moralist and philosopher, but his last triumphs as a composer and musical theoretician also occur about this time. His opera *Le Devin du Village* was performed before the King at Fontainebleau in 1752 and his *Letter on French Music* (1753) created an enormous stir as part of a large-scale argument over the relative merits of the French and Italian styles.

Rousseau was soon to turn his back on Parisian society. He wrote a further, very original, essay on social questions, *Discourse on the Origin of Inequality* (1755) but then withdrew to the countryside the better to meditate and write about his new concerns, attracting the scorn of many of his erstwhile friends. Around this time he returned to the Protestant faith of his childhood, and reclaimed

his citizenship of Geneva. The *Discourse on the Origin of Inequality* has a passionate dedication to Geneva.

During the next six years, Rousseau wrote the bulk of his greatest work: his masterpiece of educational theory, *Émile* (1762); of political theory, *The Social Contract* (1762); but also a best-selling novel, *La Nouvelle Héloïse* (1761) and a host of smaller pieces: the *Letter to M. d'Alembert on the Theatre* (1758); the *Letter to Voltaire on Providence* (1756), the *Moral Letters* (1757–8), written to Sophie d'Houdetot with whom Rousseau was then desperately in love.

Catastrophe befell Rousseau in 1762 after the publication of *Émile*. A section of it, the so-called *Creed of a Savoyard Vicar*, was judged unacceptable by the religious authorities and out of fear of being imprisoned Rousseau fled Paris in June 1762. Unsettled years followed, mostly spent in different parts of Switzerland. Rousseau wrote extensively in defence of himself and his work during this time, including his *Letter to Christophe de Beaumont, Archbishop of Paris* (1763) written in reply to the condemnation of the *Creed of a Savoyard Vicar*; and his *Lettres Écrites de la Montagne* (Letters Written from the Mountain) (1764), a response to criticism of him made by Geneva's attorney-general. From January 1766 Rousseau spent just over a year in England at the invitation and in the company of David Hume. Rousseau, almost always a touchy and suspicious person, was at that time in the grip of a severe paranoiac breakdown and he became convinced Hume was plotting to humiliate him. An account of this sorry episode was given by Hume (*A Concise Account*, 1766). Exhausted and ill, Rousseau returned to France in early 1767 and sought refuge well away from the public gaze near Grenoble where he married Thérèse.

The tide of public opinion was slowly turning, and in 1770 he returned to Paris very much a celebrated figure and object of curiosity, even though he was banned from writing and speaking on controversial matters. Despite his grave mental distress, Rousseau had, from around 1764, been working on his great autobiography, *Confessions*. He completed part one by 1770. He gave some private readings of parts of the text; these also were banned. Other personal works occupied the bulk of the last decade of his life. There is an extensive essay in self-justification and defence, *Rousseau Judge of Jean-Jacques: Dialogues* (1772–6). Its completion was marked by another episode of desperate mental anguish as Rousseau attempted to place the manuscript on the altar at Nôtre Dame. Later in 1776, returning home from a walk, Rousseau was knocked down by a dog. This accident seems, miraculously, to have cleared his mind and his last work, *Reveries of the Solitary Walker* (1776–8), has a simplicity and clarity of manner missing from the writings of the preceding years.

Not all his work was in self-vindication however. He wrote at length on the political problems of Poland (*Considerations on the Government of Poland*) (1769–70), prepared a *Dictionary of Music* (1767) and botanized extensively, also writing some short works on the topic (*Elementary Letters on Botany* and *Dictionary of Botanical Terms*, uncompleted). He died at Ermenonville in June 1778, outlived by Thérèse for twenty-two years.

It is useful to give more information about Rousseau's life than is usual for most philosophers or political theorists, since so much of his work arises from events in his life or is directly about himself. This is, however, not so true of his principal works of social and political theory, just because they are works more purely of theory. They provide the most solid basis for Rousseau's reputation, and an account of these follows.

2 *Works leading up to* The Social Contract

From 1750 onwards, Rousseau developed increasingly deeper and more sophisticated ideas about the origin and nature of the condition of man in society and about what could and should be done to ameliorate that condition. His discussion of these themes in his first serious work, *Discourse on the Sciences and Arts*, is fairly shallow. He argues that increasing scientific knowledge and refinement of arts and letters does not at all produce an improvement of morals either in individuals or in society at large. On the contrary, such sophistication is the offshoot of luxury and idleness and it has developed principally to feed people's vanity and desire for ostentatious and aggressive self-display. All these features work against the moral virtues of loyalty to one's country, courage in its defence and dedication to useful callings. Rousseau allows for the fact that there are a few people of genius who genuinely enrich humanity by their ideas. But the majority of us are not improved, but harmed, by exposure to the 'higher learning'.

This essay attracted considerable notice and a number of replies, to which Rousseau responded with care. But he did not continue immediately with his works of social criticism. His musical interests intervened, although with some of these his social and moral ideas became entwined. In his *Letter on French Music* (1753), Rousseau criticizes French music as monotonous, thin and without colour because the spoken language (in which all music is rooted) is thus also. This is because, as Rousseau explains in his *Essay on the Origin of Languages* (1755–60, but never completed), the

French language has been shaped by the imperatives of calling for help and controlling other people, which require harshness and clarity above all else. In warmer southern climes it is the sweet accents of love and passion which colour the language hence the supremacy of Italian opera. Thus social and political demands shape even the nature of music, according to Rousseau. Effective government also requires sharp, impressive utterance, he maintains, and it is to the origin and function of government that Rousseau turns in his so-called second *Discourse*, the *Discourse on the Origin and Foundations of Inequality*, to give it its full title. This is a very substantial essay and one of Rousseau's most important works.

In *Discourse on the Origin and Foundations of Inequality* Rousseau gives an account of the 'fall' of natural humankind, its degeneration and corruption as it joins together with others to make up tribes, societies and eventually states. Natural man (the 'noble savage') left alone in his natural environment is self-sufficient, largely absorbed in present feeling without foresight or recollection, solitary, peaceable and, in fact, most often asleep. (Rousseau may well have had the orang-utan in view here.) Inclement circumstances, increase in numbers (arising from hasty couplings in the forest devoid of all the artificial trappings of romantic love), force people to live together. Sexual jealousy, the desire for domination, vindictive resentments grow up as men come to demand esteem and deference. *Amour-propre*, an anxious concern for tribute to be paid to one's status, replaces *amour de soi*, a simple healthy concern for one's own natural wellbeing. Men begin to compete for precedence and life is tainted by aggression and spite. Those who have acquired dominance then conspire together to consolidate their position. They argue that everyone needs a more peaceable and stable society, which can only be achieved through the apparatus of government, law, punishments. Thus it is that they consolidate the *status quo*, but without right or justice and acting only to perpetuate unfair privilege and the oppression of the weak.

This extraordinarily subversive essay seems to have attracted no official censure; that came later in connection with other works. Rousseau's other significant essay on political themes from this period is the so-called *Discourse on Political Economy*(1755, first published separately 1758), which began life as an entry for Diderot and D'Alembert's *Encyclopaedia* (1751–72). A very eloquently written piece, it shows clear signs of being a preliminary study for *The Social Contract*. Much play is made with the idea of the sovereignty of all the people over themselves, expressing their legislative intent through the general will. Emphasis is laid on the need to cultivate patriotic republican loyalties in citizens if a just society of equals united by common care and respect is ever to arise and to survive. The essay ends with a discussion of taxation and fiscal issues, but the principal force of the argument lies in the discussion of the source of legitimate law in 'the people'. It is this same issue which Rousseau places at the centre of his now most famous work, *The Social Contract*.

3 The Social Contract

This work is generally regarded as an essential entry in the canon of classic works in political theory and as Rousseau's masterpiece. Many people read nothing else of his. This is a pity, for many of the themes in it are rendered unnecessarily hard to understand by being taken in isolation. Also, the work is in some ways poorly constructed and uses idea drawn from different times in Rousseau's development. As he says in a prefatory note to the work, it is the only residue remaining of a project begun many years before. However, we must take the work as we find it. Its present reputation would perhaps have surprised contemporary readers. *Émile* was considered a more seditious work; and *La Nouvelle Héloïse* regarded as the most perfect exhibition of Rousseau's genius. Certainly Hume regarded Rousseau's own good opinion of *The Social Contract* as quite absurd.

The Social Contract is divided into four parts. Roughly speaking, Book One concerns the proper basis for the foundation of a legitimate political order; Book Two the origin and functions of the sovereign body within that order; Book Three considers the role of government, which Rousseau treats as a subsidiary body in the state deriving its powers from the sovereign; and Book Four considers more issues regarding a just society, treating of the Roman republic at some length and of the functions of civil religion. It is important always to remember that the book is subtitled: *The Principles of Political Right*. Rousseau's paramount concerns are normative, with the nature and basis of legitimacy, justice and right and not simply with *de facto* political structures. A useful brief summary of the principal themes of the work is given in Book Five of *Émile*, as part of Émile's political education.

Rousseau argues that it is our lack of individual self-sufficiency that requires us to associate together in society. But, when we do so, we do not want to have to accept a condition of enslavement as the price of our survival. Freedom is an essential human need and the mark of humanity; mere survival without that does not constitute a human life. Rousseau holds that freedom and association can only be combined if all the persons of the association make up the sovereign body for that

association, that is, the final authoritative body which declares the law by which the people wish to bind themselves. This law is a declaration of the 'general will'.

The notion of the general will is wholly central to Rousseau's theory of political legitimacy (see GENERAL WILL). It is, however, an unfortunately obscure and controversial notion. Some commentators see it as no more than the dictatorship of the proletariat or the tyranny of the urban poor (such as may perhaps be seen in the French Revolution). Such was not Rousseau's meaning. This is clear from the *Discourse on Political Economy* where Rousseau emphasizes that the general will exists to protect individuals against the mass, not to require them to be sacrificed to it. He is, of course, sharply aware that men have selfish and sectional interests which will lead them to try to oppress others. It is for this reason that loyalty to the good of all alike must be a supreme (although not exclusive) commitment by everyone, not only if a truly general will is to be heeded, but also if it is to be formulated successfully in the first place.

This theme is taken up in Book Two. Here Rousseau appeals to the charisma of a quasi-divine legislator to inspire people to put the good of their whole community above their own narrow selfish interest and thereby gain a greater good for themselves. In the course of this Book, Rousseau alludes to Corsica as having a people who have the sentiments and capacities to establish just laws and a good state (Book Two, ch. 10). His passing remark that 'I have the feeling that some day that little island will astonish Europe' has caused some fancifully to suppose that he foresaw the emergence of Napoléon.

Book Three of *The Social Contract* concerns the role of government. Rousseau knows that governors often rule in their own interest, not in the interests of their community. For this reason he argues that governmental functions must be thoroughly subordinate to the sovereign judgment of the people and that it is essential to adjust the form and powers of government to suit the different circumstances (size, dispersion and so on) of different states. It still surprises some readers that Rousseau has no particular enthusiasm for democratic government. Of course, the constitution and functions of the sovereign body are a different matter.

Book Four has something of a disjointed character. Rousseau discusses the Roman republic at considerable length, principally to hold it up as a model from which, in his opinion, there has been a terrible falling away. But he also discusses civil religion, arguing that divine sanctions should be joined to civil laws the better to procure obedience to them and people's loyalty to the common good of all in their nation.

Rousseau made wholly central to his vision of political right the union of free and equal men devising for themselves the laws under which they shall then proceed to live their lives as citizens one with another of their own state. In doing so he depicted a form of political community which exerts a very great appeal and influence on the modern imagination. We are still learning to live with the consequences of that appeal.

Rousseau's political concerns were not confined to theory alone. On two occasions he was approached for help with the political affairs and constitutional problems of countries. In 1764 he wrote an unfinished fragment, *Project for a Constitution for Corsica*, in response to a plea for help and guidance from the Corsican rebels. Then again, in 1769–70, Rousseau wrote extensively on the constitutional and legislative problems facing Poland (*Considerations on the Government of Poland*) in response to a request from persons opposed to Russian domination. This work (not properly published in Rousseau's lifetime) is a substantial essay which throws a lot of light on how Rousseau envisaged his theoretical notions working out in historically specific situations. He reveals many shrewd and hard-headed practical insights.

4 Émile *(or* On Education*)*

There is some evidence that Rousseau regarded *Émile* as his most mature and well-achieved work. In his self-evaluating *Rousseau Judge of Jean-Jacques: Dialogues* (1772–6) he specifies it as the book in which someone who is truly concerned to understand him will find his ideas most deeply and comprehensively expressed. Posterity has, perhaps unfortunately, not generally endorsed this evaluation.

Precisely when he began work on *Émile* is unclear, but it must have been around 1759 when Rousseau was at the peak of his creative powers. Its immediate occasion seems to have been a request from certain of his distinguished women friends to give them his advice about the upbringing of their children; and indeed, the subtitle of the book is *On Education*. However, within this framework Rousseau gives us his deepest ideas about the origins of human evil and wickedness and about the prospects for a whole and happy life.

Émile is structured as the narrative of the upbringing of a young man (Émile himself) who is to be spared the pain and loss of human corruption but made whole and entire by following the teachings of 'nature'. The work also includes in Book Four a long more-or-less self-contained essay

on the basis and nature of religious belief, called the *Creed of a Savoyard Vicar*. Rousseau puts his religious ideas into the mouth of a fictitious priest, although one modelled on priests he had previously known. It was this section which attracted the condemnation of the Catholic authorities and led to the burning of the book in June 1762. Rousseau then fled Paris, condemned to almost ten years of distress and displacement. He wrote at some length in defence of these religious ideas, in his *Letter to Christophe de Beaumont, Archbishop of Paris* of 1763 (see §5).

Rousseau held that most men and women in contemporary society were corrupted and their lives deformed because of the nature and basis of their social relationships and of the civil order (see §2). That man is good by nature, but is perverted by society, is perhaps the dominant theme of *Émile*. Thus, if a person is to live a whole and rewarding life they must first be protected from such damaging influences and then be given the personal resources and emotional and moral dispositions to enable them to develop in a creative, harmonious and happy way once they do enter society. The principal discussions in *Émile* are devoted to studying the deepest causes of health or sickness in human development, both those internal to the individual and those coming from external influences, at each stage in the growth and maturation of a person from infancy to adulthood.

In early life it is the tendency to imperious rage and the petulant demand for others' immediate compliance to one's wishes that must be checked. Children must certainly not be tormented, but neither must they be indulged since that gives rise to both misplaced expectations and to even less capacity to cope with setbacks. Children need to be treated in a steady, predictable and methodical way, as if not in contact with other humans at all at first. Thus they learn to manage in a practical and efficacious way with concrete issues and not to engage in a battle of wills and in contention for dominance.

This motif of living according to nature – that is, according to the actualities of our powers and real circumstances – continues as Émile matures. As and when he needs to find a place for himself in society he will not try to control all that is around him and be aggrieved if he cannot as if he were a despot. Rather, he will seek to establish relations grounded in friendship, mutual respect and cooperation proper to finite and needy beings. Our capacity to feel compassion for each other and our acceptance of compassion with gratitude forms, in Rousseau's view, the fundamental basis for human union and the true explanation of the Golden Rule. Real moral demands are not imposed on us from outside, nor are they precepts discovered by reason. Rather, they express the requirements by which a bond of creative respect can be sustained between equals. This same issue of maintaining self-possession and mutual respect shapes Rousseau's treatment of marriage and sexual relations in Book Five. Such intimate union holds out the greatest hopes of human happiness, but can also lead to enslavement to the whims of the beloved. Feminist critics have found Rousseau's depiction of the character and role of Émile's intended, Sophie, objectionable, in that she appears to be stereotyped as largely passive and destined for traditional domestic occupations.

In the controversial material on religious belief Rousseau argues that we know God not by reason, but through simple feelings and convictions much deeper and more permanent than any theorems of reason. Such feelings teach us that the world is animated by a loving and powerful intelligence, who is God. Rousseau spends some time denouncing religious factionalism and intolerance which he sees as wholly incompatible with Christ's message of love and forgiveness. There can be no serious doubt that these are Rousseau's own thoughts. The rhetorical distance provided by the figure of the vicar is very slight.

In his deep and subtle psychological insights into the damage aggression does, not just simply to the victims of aggression, but in a complex and concealed way to the aggressors themselves, Rousseau shows the greatness of his mind in *Émile*.

5 Controversial works

Rousseau did not take the condemnation of the *Creed of a Savoyard Vicar* lightly. Almost as soon as he had settled again after his flight from Paris, he wrote a lengthy reply to the criticism of his work made by Christophe de Beaumont, Archbishop of Paris. Written in the form of a letter, Rousseau defends the fundamental tenets of his work. He has always held, he says, that man is naturally good, but corrupted by society. It is therefore a mystery why his work should only now be singled out for condemnation. He then mounts a point-by-point reply to the Archbishop's criticisms, arguing that the religion of the priests and the dogmas of the Church must never be confused with the true gospel of charity and love taught by Christ. This *Letter to Christophe de Beaumont, Archbishop of Paris* was published in 1763. It ends on a note of self-aggrandizement. So far from being reviled, Rousseau says, statues of himself should be erected throughout Europe.

Just a year later, Rousseau published his extensive *Lettres Écrites de la Montagne* (Letters Written from the Mountain). In 1763, the Genevan

attorney-general, Jean-Robert Tronchin, had written in defence of the authorities in their condemnation of Rousseau's works in his *Letters Written from the Country* (hence Rousseau's oppositional title). Rousseau again replies at length, arguing that the Geneval political system had become very corrupt, but also defending once more the basic principles of his thought.

These two works date from the period just after the condemnation of Rousseau's most famous works. But prior to that he had also been engaged in some controversial exchanges. In 1758 he wrote the *Letter to M. d'Alembert on the Theatre* in which he argues that to establish a theatre in Geneva would corrupt the honest morals and civil integrity of that city-state. This was in opposition to d'Alembert's argument, presented in an article on Geneva for the *Encyclopaedia*, that a theatre would improve the cultural life of that city. However, such sophistication is not a benefit, in Rousseau's opinion; it goes along with deceit and the abandonment of morally commendable activities. Rousseau writes with great verve in this essay, harking back to some of his themes in his first discourse, *Discourse on the Sciences and Arts*.

A similar clash between urbane civilization and (what Rousseau liked to see as his own) plainness and simplicity of heart occurs in the exchange with VOLTAIRE on the providence of God (written in 1756; Voltaire may also have been an influence on d'Alembert). Voltaire, in his poem on the Lisbon earthquake, had written scornfully of Leibnizian optimism that all is for the best in the best of all possible worlds. Rousseau retorts that one must rest one's certainty of God's providence in feeling, not on the subtleties of philosophical reasoning. More personally, he says that it is surprising to find the wealthy and successful Voltaire complaining against God when he, Rousseau, who lives in poverty and obscurity, sees only the blessings of existence. This *Letter to Voltaire on Providence* also makes some very sharp points against religious intolerance, prefiguring the ideas of the *Creed of a Savoyard Vicar*. Rousseau's controversial writings are among his most eloquent, even though they do not generally add much to our appreciation of his overall intellectual achievement.

6 La Nouvelle Héloïse *and other literary works*

Outside the narrow circle of the intelligensia and his aristocratic patrons, Rousseau was probably best known during his lifetime for his novel of illicit passion, reconciliation and self-transcendence, *Julie, ou La Nouvelle Héloïse*. At a time when works in different genres were not so sharply compartmentalized, David Hume for one saw in this novel the most perfect expression of Rousseau's genius and could not understand why Rousseau seemed to value *The Social Contract* more.

Rousseau professed himself surprised and dismayed to be writing the work. In 1756 he had turned his back on the hot-house world of fashionable Parisian society, wishing to dedicate the rest of his life to working for the good of humankind. However, as he took solitary walks in the forest of Montmorency, be became absorbed in an imaginary world of passion and illicit love. In a fever of erotic ecstasy he wrote the first of the letters between Julie, her tutor-lover Saint-Preux and her friend and cousin Claire. Saint-Preux confesses his love for Julie; a love which she tries to fend off through intimate conversations instructing him to be virtuous and pure. Of course, this does not work and she finally gives herself over to him in a passion. But her father has other plans for her. She is betrothed to the Baron de Wolmar; Saint-Preux leaves and not until much later does he return to become tutor once more, but now to Julie's two young sons. Wolmar (who has come to know of their earlier intimacy), leaves Julie and Saint-Preux alone on his model estate at Clarens. Saint-Preux confesses that he had never ceased to love Julie, but the novel ends tragically with the death of Julie, who has contracted pneumonia after having saved one of her children from drowning.

As Rousseau wrote this work nature seemed to imitate art. Sophie d'Houdetot, the sister-in-law of Madame d'Épinay whose house Rousseau was then living in, visited him and Rousseau fell in love with her. He saw in her the incarnation of his imaginary Julie. The relationship did not endure. Rousseau became morbidly suspicious that his middle-aged love was being mocked behind his back by his erstwhile friends.

La Nouvelle Héloïse was published in 1761 and was a bestseller. It is seldom read these days, except to be mined for ideas which might illuminate Rousseau's social and political philosophy. Wolmar's model estate is sometimes argued to be Rousseau's own vision of an ideal community, with rigid paternalistic control and substantial manipulation of the inhabitants by the all-seeing, all-knowing Wolmar. It is scarcely clear that this was Rousseau's intention. The fact that Julie dies, despite living at Clarens, may be taken to imply that it provides no adequate human habitation.

The rest of Rousseau's literary output is slight. It includes a number of mostly short poems, dating from the early 1740s, some plays (also mostly early), one of which, *Narcissus* (Self-Lover), received performance in 1752 and for which Rousseau wrote a substantial preface explaining how his

theatrical writing could be squared with his then political and social polemic against civilized letters.

7 Autobiography and other personal works

The last ten or so years of Rousseau's life were primarily given over to the writing of works of autobiography and other substantial essays of self-explanation and justification. These were presaged in his four *Letters to Malesherbes* written in 1762, just before the catastrophe of the banning of *Émile* and *The Social Contract*. Malesherbes, although official censor and likely to be suspicious of Rousseau's subversive ideas, in fact took a highly intelligent and sympathetic interest in his work. Rousseau became fearful that the printing of *Émile* was being held up by Jesuit plotting. Through Madame de Luxembourg, Malesherbes was contacted and able to put Rousseau's mind to rest. Rousseau expressed his gratitude by writing to Malesherbes four semi-confessional letters, setting out the principal events of his life and trying to make his motives and character plain to Malesherbes. Rousseau writes that he is not a misanthrope; he seeks the country only because he can live there more freely and fully as himself. He wants, in fact, nothing more than to serve humankind, but he can best do this by keeping himself apart and not getting embroiled in quarrels and back-stabbing.

Around this time Rousseau began to assemble materials towards writing an autobiography. He worked on and off at this until 1767, by which time part one of what we now know as *Confessions* was completed. This still extraordinary work of self-disclosure and candour is one of the most remarkable books ever written. It includes some beautiful writing about childhood and about his travels, but also revelations of a most intimate and shameful kind. Part one covers the period up to 1741–2, when Rousseau left Madame de Warens to make his way in Paris. Part two (1769–70) is less successful. Rousseau's morbid fears sometimes surface here as he describes the events of the years 1742–65, including his foolish passion for Sophie d'Houdetot, the writing and publication of *Émile*, and so on. The book breaks off in 1765, just as Rousseau is about to leave for England in the company of Hume, there (he believed) further to be ensnared. As the revelation of the quality of being of another human soul, *Confessions* is almost without equal.

Another lengthy work of self-explanation is *Rousseau Judge of Jean-Jacques: Dialogues* (published, like *Confessions*, posthumously). This is in three parts, cast in the form of dialogues between 'Rousseau' and 'a Frenchman', who together try to delve beneath the surface to find out the true nature of 'Jean-Jacques', the real Rousseau. The innumerable lies put about regarding Jean-Jacques are considered and exposed in the first part; in the second, a visit is paid to him and his true character is revealed; in the third part, a careful reading of his works is made and their true meaning explained. Although sometimes obsessively detailed and very repetitive, this work has considerable interest for the light it throws on Rousseau's own estimate of his achievement. The overall tone is, it is thought, marred by lengthy self-justification.

Rousseau's last work of self-accounting is *Reveries of the Solitary Walker* (left unfinished at his death). Cast in the form of 'Walks', it comprises a series of reflections, ideas and meditations which supposedly occurred to Rousseau as he went on his perambulations in and around Paris. Rousseau returns to special moments in his life – his love for Mme de Warens; the episode of the stolen ribbon; his 'illumination' on the way to see Diderot. But he also reflects for one last time on some of his major intellectual preoccupations – on the depth of *amour-propre*; on the sources of malice; and on the nature of happiness. There is a clear steadiness of vision which pervades this work which contrasts markedly with the often distressed and distressing writing of the preceding five years.

After his death, Rousseau's grave on the Île des Peupliers at Ermenonville became a place of pilgrimage for Parisians and Rousseau was embraced as one of the great sons of France. His influence remains very great, not only because of his political writings which have become part of the permanent canon of works in political theory, but also because of his more imponderable effect on sensibility and attitudes. His love of nature and stress on the value of the simple life, as well as his far-reaching explorations of his own character and feelings, make him a central figure in the development of romanticism. The emphasis in his educational writings on discouraging the coercion of the child into tasks which are apparently pointless undoubtedly influenced the work of Montessori and A.S. Neill. Even Rousseau's musical writings and compositions, seldom studied these days, made a marked impact on the history of opera in particular. His place as one of the major figures of Western civilization is secure, even though he can still attract violent differences of opinion.

ROYCE, JOSIAH (1855–1916)

Josiah Royce rose from a humble background in the California of the Gold Rush period to become Professor of the History of Philosophy at Harvard University and one of the most influential American philosophers of the so-called 'period of classical American philosophy' from the late nineteenth to the early twentieth century. He was also (along with F.H. Bradley) one of the two most important English-speaking philosophers of the period who defended philosophical idealism: the doctrine that in some sense or other all things either are minds or else are the contents of minds. Royce remained loyal to his own idealist commitments throughout his life, despite the fact that his friend and Harvard colleague William James was extremely hostile to idealism, and that his intellectual environment was increasingly dominated by the 'pragmatism' of which James was an outspoken champion. In later years, however, under the influence of another pragmatist, Charles S. Peirce, Royce gave the themes of his idealist thought a naturalistic social foundation rather than the abstract metaphysical foundation of his earliest writings. Royce's entire corpus is perhaps best seen as representing a bridge from the German world of Neo-Kantianism and various varieties of philosophical idealism to the American world of pragmatism and of philosophical naturalism.

ROBERT W. BURCH

RULE OF LAW (RECHTSSTAAT)

The 'rule of law' most simply expresses the idea that everyone is subject to the law, and should therefore obey it. Governments in particular are to obey law – to govern under, or in accordance with, law. The rule of law thus requires constitutional government, and constitutes a shield against tyranny or arbitrary rule: political rulers and their agents (police and so on) must exercise power under legal constraints, respecting accepted constitutional limits. The British and US conceptions of this ideal find a parallel in the Germanic concept of the *Rechtsstaat*, or 'state-under-law', where the state as an organized entity is conceived to be limited by laws and by fundamental principles of legality, rather than being a purely political organization that can dispense with law in the interests of policy. Such concepts play an essential part in the political philosophy of liberalism; yet, characteristically, their more detailed exposition and indeed their nature and meaning are contested and controversial.

In a wider sense, the rule of law articulates values of procedural fairness or due process which affect the *form* of legal rules and govern the manner of their application. Those values both enhance the utility of legal regulation and also acknowledge underlying ideas of human dignity and autonomy. In a further sense, the rule of law refers to the faithful application of those rules and principles which constitute the law of a particular legal system. It expresses the idea that legal obligation should always be determined in particular cases by analysis of existing law – as opposed to *ad hoc* legislation by judges – even where disagreement may exist about the true meaning or content of the law.

The connection between the rule of law and justice is complex. The rule of law cannot itself guarantee justice, but it forms an essential precondition. In so far as it imposes formal constraints on the laws enacted or enforced, which ensure that they are capable of being obeyed and that they are fairly administered, the rule of law assumes a conception of moral personality – of how individuals should be treated, as responsible human beings, capable of a sense of justice – which links the idea with the values of freedom and autonomy, and the ideal of equality.

RUSSELL, BERTRAND ARTHUR WILLIAM (1872–1970)

Bertrand Russell divided his efforts between philosophy and political advocacy on behalf of a variety of radical causes. He did his most important philosophical work in logic and the philosophy of mathematics between 1900 and 1913, though later he also did important work in epistemology, metaphysics and the philosophy of mind, and continued to contribute to philosophy until the late 1950s. He wrote relatively little on ethics. His political work went on until his death in 1970.

In the philosophy of mathematics Russell's position was logicism, the view that all of mathematics can be derived from logical premises, which he attempted to establish in detail by actual derivations, creating in the process what is essentially now the standard formulation of classical logic. Early in this work he discovered the self-referential paradoxes which posed the main difficulty for logicism and which he eventually overcame by the ramified theory of types.

Logic was central to Russell's philosophy from 1900 onwards, and much of his fertility and importance as a philosopher came from his application of the new logic to old problems. Among his most important logical innovations were the modern theory of relations and the theory of descriptions. The latter enabled him to re-parse sentences containing the phrase 'the so-and-so' into a form in which the phrase did not appear. The importance of this theory for subsequent philosophy was that it enabled one to recast sentences which apparently committed one to the existence of the so-and-so into sentences in which no such commitment was suggested. This laid the basis for a new method in metaphysics (widely pursued by Russell and others in the first half of the century) in which theories about items of a given kind are reformulated so as to avoid reference to items of that kind.

Logicism itself offers just such a treatment of mathematics and in his later work Russell used the method repeatedly, though the reformulations he suggested were rarely so explicit as the ones he had offered in mathematics. In 1914 he proposed a solution to the problem of the external world by constructing matter out of sensibilia. After 1918 he proposed to construct both mind and matter out of events. After 1940 he treated all particulars as bundles of qualities. In each case his motivation was to avoid postulating anything that could be constructed, thereby eliminating ontological commitments which had no independent evidential support. Outside mathematics, his starting-point was the empirically given and he attempted to make his constructions depend as little as possible upon items not given in experience. He was not, however, a strict empiricist, since he did not think that empirical evidence alone would be sufficient for the constructions and he was always prepared to supplement it in order to obtain them. He wanted to construct, not those items which were empirically warranted, but those which were required by the relevant scientific theories, for he regarded science as the best available, though by no means an infallible, source of truth. The task, in each case, was therefore to reveal the least amount of apparatus that would have to be assumed in addition to the empirical data in order for the constructions required by science to be possible. This methodology, which he pursued throughout his career, gives an underlying unity to what, more superficially, appears as a series of abrupt changes of position.

NICHOLAS GRIFFIN

RUSSIAN PHILOSOPHY

Introduction

Russian thought is best approached without fixed preconceptions about the nature and proper boundaries of philosophy. Conditions of extreme political oppression and economic backwardness are not conducive to the flowering of philosophy as a purely theoretical discipline; academic philosophy was hence a latecomer on the Russian scene, and those (such as the Neo-Kantians of the end of the nineteenth century) who devoted themselves to questions of ontology and epistemology were widely condemned for their failure to address the country's pressing social problems. Since Peter the Great's project of Westernization, Russian philosophy has been primarily the creation of writers and critics who derived their ideals and values from European sources and focused on ethics, social theory and the philosophy of history, in the belief that (as Marx put it in the first 'Thesis on Feuerbach') philosophers had hitherto merely interpreted the world: the task was now to change it. This passionate social commitment generated much doctrinaire fanaticism, but it also inspired the iconoclastic tendency made philosophically respectable by Nietzsche: the revaluation of values from an ironic outsider's perspective. The principal contribution of Russian thinkers to world culture has so far consisted not in systems, but in experiments in the theory and practice of human emancipation. Some of these led to the Russian Revolution, while others furnished remarkably accurate predictions of the nature of utopia in power. Like Dostoevskii's character Shigalëv who, starting from the ideal of absolute freedom, arrived by a strict logical progression at the necessity of absolute despotism, Russian philosophers have specialized in thinking through (and sometimes acting out) the practical implications of the most seductive visions of liberty that Europe has produced over the last 200 years.

1 The development of Russian philosophy

What Berdiaev called the 'Russian Idea' – the eschatological quest that is the most distinctive feature of Russian philosophy – can be explained in terms of Russian history. The Mongol yoke from the twelfth to the fourteenth century cut Russia off from Byzantium (from which it had received Christianity) and from Europe: it had no part in the ferment of the Renaissance. Its rise as a unified state under the Moscow Tsardom followed closely on the fall of the Orthodox Byzantine Empire, and the emerging sense of Russian national identity incorporated a messianic element in the form of the monk Philotheus' theory of Moscow as the 'Third Rome', successor to Rome and Constantinople as guardian of Christ's truth in its purity. 'There will not be a fourth', ran the prophecy: the Russian Empire would last until the end of the world. Russian thought remained dominated by the Greek patristic tradition until the eighteenth century, when the Kievan thinker Skovoroda (sometimes described as Russia's first philosopher) developed a religious vision based on a synthesis of ancient and patristic thought. He had no following however; by the mid-century Russia's intellectual centre was St Petersburg, where Catherine the Great, building on the achievements of her predecessor Peter, sought to promote a Western secular culture among the educated elite with the aid of French Enlightenment ideas. But representatives of the 'Russian Enlightenment' were severely punished when they dared to cite the *philosophes'* concepts of rationality and justice in criticism of the political status quo. The persecution of advanced ideas (which served to strengthen the nascent intelligentsia's self-image as the cultural and moral leaders of their society) reached its height under Nicolas I (1825–55), when philosophy departments were closed in the universities and thought went underground. Western ideas were the subject of intense debate in small informal circles of students, writers and critics, the most famous of which in Moscow and St Petersburg furnished the philosophical education of such intellectual leaders as the future socialists Herzen and Bakunin, the novelist and liberal Ivan Turgenev, the literary critic Belinskii (from whose 'social criticism' Soviet Socialist Realism claimed descent), and the future Slavophile religious philosophers Kireevskii and Khomiakov. As a critic has noted: 'In the West there is theology and there is philosophy; Russian thought, however, is a third concept'; one which (in the tsarist intellectual underground as in its Soviet successor) embraced novelists, poets, critics, religious and political thinkers – all bound together by their commitment to the goals of freedom and justice.

In the 1830s these beleaguered individuals encountered German idealism: an event of decisive significance for the future development of Russian thought. The teleological structures of idealist thought provided Russian intellectuals with a redemptive interpretation of their conflicts and struggles as a necessary stage in the dialectical movement of history towards a transcendent state of harmony. Idealism (notably in its Hegelian forms) left its mark on the vocabulary of subsequent Russian philosophy, but its principal legacy was the belief, shared by the vast majority of Russian thinkers, that an 'integral worldview', a coherent and unified vision of the historical process and its goal, was the essential framework both for personal moral development and social theorizing. The question of history's goal became a matter for intense debate among the intelligentsia with the publication in 1836 of Chaadaev's 'Philosophical Letter', which posed Russia's relationship to the West as a central philosophical problem, maintaining that Russia's historical separation from the culture of Western Christianity precluded its participation in the movement of history towards the establishment of a universal Christian society. Chaadaev's version of the march of progress was much indebted to French Catholic conservatism, while the nationalist riposte to his ideas drew heavily on the Romantics' critique of the Age of Reason and Schelling's organic conception of nationhood: the Slavophiles held that Western culture was in a state of terminal moral and social decline, suffering from an excess of rationalism, which had led to social atomization and the fragmentation of the individual psyche. These divisions could be healed only by religious faith in its purest form, Russian Orthodoxy, whose spirit of organic 'togetherness', uncontaminated by Western rationalism, they presented as a model for Russian society and a beacon for mankind. They thereby laid the foundations of a distinctively Russian tradition of cultural and religious messianism which includes Dostoevskii's political writings, the Pan-Slavist and Eurasian movements (see Dostoevskii, F.M.), and the apocalyptic vision of Berdiaev, whose philosophy was highly popular among the Soviet underground.

Secular and Westernist thinkers tended to be scarcely less messianic in their response to Chaadaev's pessimism. The first philosophers of Russian liberalism interpreted their country's past and future development in the light of Hegel's doctrine of the necessary movement of all human societies towards the incarnation of Reason in the modern constitutional state, while the Russian radical tradition was shaped successively by the eschatological visions of the French utopian socialists, the Young Hegelians and Karl Marx. Herzen defined the

distinctive characteristic of Russian radical thought as the 'implacable spirit of negation' with which, unrestrained by the European's deference to the past, it applied itself to the task of freeing mankind from the transcendent authorities invented by religion and philosophy; and the radical populist tradition that he founded argued that the 'privilege of backwardness', by permitting Russia to learn both from the achievements and the mistakes of the West, had placed it in the vanguard of mankind's movement towards liberty.

Russian religious philosophers tended to see themselves as prophets, pointing the way to the regeneration of human societies through the spiritual transformation of individuals. Vladimir Solov'ëv (regarded by many Russians as their greatest philosopher) believed that his country's mission was to bring into being the Kingdom of God on Earth in the form of a liberal theocracy, which would integrate knowledge and social practice and unite the human race under the spiritual rule of the Pope and the secular rule of the Russian tsar. His metaphysics of 'All-Unity' was a dominant force in the revival of religious and idealist philosophy in Russia in the early twentieth century, inspiring an entire generation of thinkers who sought to reinterpret Christian dogma in ways that emphasized the links of spiritual culture and religious faith with institutional and social reform, and progress in all other aspects of human endeavour. Among them were leading Russian émigré philosophers after 1917, such as Semën Frank, Bulgakov (who sought to create a new culture in which Orthodox Christianity would infuse every area of Russian life), Berdiaev (who was strongly influenced by the messianic motifs in Solov'ëv), and Hessen, who offered a Neo-Kantian and Westernist interpretation of the notion of 'All-Unity'. A number of émigré philosophers (notably Il'in and Vysheslavtsev) interpreted Bolshevism as the expression of a spiritual crisis in modern industrialized cultures. Many blamed the Russian Revolution on infection from a culturally bankrupt West which (echoing the Slavophiles, Dostoevskii and Leont'ev) they presented as corrupted by rationalism, positivism, atheism and self-centred individualism (although few have gone as far as the fiercely polemical Losev who, up until his death in the Soviet Union in 1988, maintained that electric light expressed the spiritual emptiness of 'Americanism and machine-production'). Most maintained a historiosophical optimism throughout the catastrophes of the first half of the twentieth century, which Berdiaev saw as a precondition for messianic regeneration, while Hessen believed that religious and cultural values would emerge triumphant from the carnage in a dialectical *Aufhebung*.

2 Major themes in Russian philosophy

The main impetus of Russian philosophy has always been towards the future, as its representatives strained to discern the features of the 'new man' (the term favoured by the left from the 1860s, with the addition of the adjective 'Soviet' after 1917), or the 'integral personality', as Slavophiles and neo-idealists preferred to describe the individual who would one day be free from the cognitive and moral defects that had hitherto prevented mankind from realizing its potential. The nature of these flaws and the specifications of the regenerated human being were the subject of bitter disputes between rival movements. Even on the left, models of the 'new man' varied widely, from the narrow rationalist who was the ideal of the 'nihilists' of the 1860s and subsequently of Lenin and Plekhanov, to Bakunin's eternal rebel, who would embody the spontaneous spirit of freedom in defiance of all established authorities and orders. At the end of the nineteenth century, in the cultural ferment produced by new movements in philosophy and the arts emanating from the West, radical thinkers began *en masse* to renounce their predominantly rationalist models of the individual and society. Nietzsche's Superman had a pervasive influence on the ensuing 'revaluation of values', undertaken with the aim of formulating moral and social ideals that would embrace the many-sidedness of human creativity. Some radical philosophers (such as Berdiaev and Frank), in the process of moving from Marxism to neo-idealism, sought to reconcile Nietzsche's aesthetic immoralism with Christian ethics, while the 'Empiriocriticist' group of Bolsheviks attempted to inject Russian Marxist philosophy with an element of heroic voluntarism by synthesizing it with Nietzschean self-affirmation and the pragmatism of Ernst Mach. Nietzschean influences combined with the mechanistic scientism of Soviet Marxism in the Soviet model of the 'new man' (whose qualities Lysenko's genetics suggested could be inherited by successive generations). In the post-Stalin 'thaw' some Soviet philosophers, including Il'enkov and Mamardashvili, began a critical rereading of Marx's texts from an anthropocentric standpoint which emphasized the unpredictable and limitless potential of human consciousness (see Marxist philosophy, Russian and Soviet).

This open-ended view of progress (officially encouraged in the Gorbachev period) is uncommon in Russian philosophy, where epistemological scepticism is more often to be encountered in uneasy combinations with eschatological faith. Like other rootless groups, Russian intellectuals were drawn to compensating certainties that seemed capable of resisting their corrosive critique. The

radical humanism of much Russian thought placed it at the forefront of the developing critical insistence on the context-dependent nature of truth; but many thinkers who attacked the claims of systems and dogmas to encompass and explain the experience and creative needs of living individuals in specific historical contexts, nevertheless retained a belief in a final, ideal state of being in which the fragmentation of knowledge would be overcome and all human purposes would coincide: a condition for whose principles some looked to science, others to religious revelation. The nihilists, who rejected metaphysics and all that could not be proven by rational and empirical methods, fervently believed that progress would inevitably lead to the restoration of a natural state of harmony between the individual and society. The empiriocriticist movement within Russian Marxism opposed the idolatry of formulas with the claim that experience and practice were the sole criteria of truth, but the group's leading philosopher, Bogdanov, looked forward to a metascience that would unify the fragmented world of knowledge by reducing 'all the discontinuities of our experience to a principle of continuity', predicting that under communism, when all would share the same modes of organizing experience, the phenomenon of individuals with separate mental worlds would cease to exist. Solov'ëv's pervasive influence on subsequent Russian religious idealism owed much to the charms of his vision of 'integral knowledge' and 'integral life' in an 'integral society'. Religious and socialist motifs were combined in some visions of an earthly paradise, such as Bulgakov's 'Christian Socialism', or Gorkii's and Lunarcharskii's creed of 'God-building', which called for worship of the collective humanity of the socialist future. In the revolutionary ferment of the first two decades of the twentieth century many religious and radical philosophers, together with Symbolist writers and poets, envisaged the leap to the harmonious future in apocalyptic terms: the novelist and critic Merezhkovskii prophesied the coming of a 'New Christianity' which would unite Christian faith with pagan self-affirmation in a morality beyond good and evil. In the aftermath of 1917 some thinkers (notably Berdiaev and members of the Eurasian movement) found consolation in apocalyptic fantasies of a new light from the East shining on the ruins of European culture.

Herzen memorably ascribed such doctrinaire utopianism to the Russian tendency to march 'in fearless ranks to the very limit and beyond it, in step with the dialectic, but out of step with the truth'. The most original and subversive Russian thinker, he was the first of a significant minority who directed the iconoclastic thrust of Russian philosophy against all forms, without exception, of messianic faith. Contending that there was no basis in experience for the belief in a purposeful universe on which the great optimistic systems of the nineteenth century were built, he urged his contemporaries to adapt their categories to the flow of life, to accept (and even welcome) the dominant role of contingency in human existence, on the grounds that individual freedom and responsibility were possible only in an unprogrammed world. Herzen's critique of the claims of metaphysical systems to predict or regulate the course of history was echoed by the 'subjective sociology' developed by Mikhailovskii and Lavrov in opposition to the deterministic scientism of the dominant Russian radical tradition. Tolstoi pointed to the chanciness of life and history in order to demonstrate the inadequacy of all attempts to formulate general rules for human societies; Dostoevskii confronted the systematizers with the lived experience of human freedom as the ability to be unpredictable; in their symposium of 1909 (frequently cited in the West as a pioneering analysis of the psychology of political utopianism) the neo-idealists of the *Signposts* movement explored the ways in which obsession with an ideal future impoverishes and distorts perception of the historical present.

Under the Soviet system a few representatives of this anti-utopian tradition ingeniously evaded the pressure on philosophers (backed up by the doctrine of the 'partyness' of truth) to endorse the official myths of utopia in power. The history of the novel form was the vehicle for Bakhtin's reflections on the 'unfinalizability' of human existence (see Bakhtin, M.M.); similar insights were expressed by the cultural-historical school of psychology established by Vygotskii, who drew on Marx to counter the mechanistic determinism of Soviet Marxist philosophy with a view of consciousness as a cultural artefact capable of self-transcendence and self-renewal. In the 1960s Soviet psychologists and philosophers such as Il'enkov helped to revive an interest in ethics with their emphasis on the individual as the centre of moral agency, while in its historical studies of culture as a system of semiotic signs, the Moscow-Tartu school brought a richly documented and undoctrinaire approach to important moral and political topics.

The insights of some of these individuals and movements into the attractions and delusions of utopian thought are lent added conviction by their own often spectacularly unsuccessful efforts to overcome what Nietzsche called 'the craving for metaphysical comfort'. Tolstoi was torn all his life beween his pluralist vision and his need for dogmatic moral certainties, while Dostoevskii in his last years preached an astonishingly crude variety

of religio-political messianism. The humanism of some later religious philosophers (including the *Signposts* authors Berdiaev and Bulgakov) is hard to reconcile with their eschatological impatience.

AILEEN KELLY

RYLE, GILBERT (1900–76)

Alongside Wittgenstein and Austin, Ryle was one of the dominant figures in that middle period of twentieth-century English language philosophy which became known as 'Linguistic Analysis'. His views in philosophy of mind led to his being described as a 'logical behaviourist' and his major work in that area, *The Concept of Mind* (1949), both by reason of its style and content, has become one of the modern classics of philosophy. In it Ryle attacked what he calls 'Cartesian dualism' or the myth of 'the Ghost in the Machine', arguing that philosophical troubles over the nature of mind and its relation with the body arose from a 'category mistake' which led erroneously to treating statements about mental phenomena in the same way as those about physical phenomena. For Ryle, to do something was not to perform two separate actions – one mental, one physical – but to behave in a certain way.

Much of Ryle's work had a similar theme: philosophical confusion arose through the assimilation or misapplication of categorically different terms, and could only be cleared up by a careful analysis of the logic and use of language. He later became preoccupied with the nature of reflective thinking, since this stood as an example of an activity which seemed to evade the behaviouristic analysis that he recommended. Ryle was also a considerable Plato scholar, though his work in this area has been less influential.

WILLIAM LYONS

S

SAINT-SIMON, CLAUDE-HENRI DE ROUVROY, COMTE DE (1760–1825)

An influential French social theorist, Saint-Simon propounded a philosophy of history and an account of the future organization of industrial society. He predicted a 'golden age', where harmony between individual capacities and social structures, reflected in a reordering of 'temporal' and 'spiritual' power, would overcome disorder and banish idleness. He has been variously portrayed as a utopian socialist, the founder of sociology and a prescient madman.

SANCHES, FRANCISCO (1551–1623)

Francisco Sanches was a sceptical philosopher and a professor of medicine at the University of Toulouse in southern France in the late sixteenth and early seventeenth century. He was born in Spain to a family of Jewish ancestry that had been forcibly converted to Catholicism, but he was brought up in France. Though he was a distant cousin of the sceptic Michel de Montaigne, he independently advanced what was perhaps the strongest sceptical critique of Aristotelianism and Platonism. In addition he developed a scepticism about mathematical knowledge claims. At the same time, he offered the first form of constructive scepticism, a way of solving intellectual problems without antecedently overcoming the sceptical challenge to traditional kinds of knowledge. He thus presented science as a way of dealing with experience, rather than as a way of gaining knowledge, and in this his views anticipate some twentieth-century philosophies. Sanches was also an important empirical medical practitioner, who presented the newest medical findings in his courses at Toulouse. His sceptical-critical views were influential in the first half of the seventeenth century, and were still being studied in Leibniz's time.

RICHARD H. POPKIN

SĀṄKHYA

Considered one of the oldest classical Hindu schools by Indian tradition, Sāṅkhya is most famous in Indian philosophy for its atheism, its dualist model of *puruṣa* (passive, individual consciousness) and *prakṛti* (non-conscious, cognitive-sentient body) and its theory that effects pre-exist in their cause. In its classical formulation the *puruṣa-prakṛti* model is analysed into twenty-five components (*tattva*) intended to encompass entire metaphysical, cognitive, psychological, ethical and physical worlds in terms of their embodiment as individual constituents and the creative and interpretive projection of those worlds as experience by and for individuals. Both the world and the individual, in other words, are considered a phenomenological refraction and projection of the underlying and constitutive components of the conscious body.

Falsely identifying with the cognitive and sensory components of *prakṛti* (which according to orthodox Sāṅkhya performs cognitive and sentient operations, but is bereft of consciousness; *puruṣa* alone is conscious), Sāṅkhyans believe themselves to be the agents of their actions, rather than recognizing that actions are processes lacking any selfhood. Sāṅkhyans claim that liberation from the suffering of repeated rebirths can only be achieved through a profound understanding of the distinction between *puruṣa* and *prakṛti*. The latter is not abandoned after liberation, but continues to operate, observed with detachment by *puruṣa*. However, according to some versions of Sāṅkhya, *prakṛti* eventually becomes dormant. *Puruṣa* and *prakṛti* both are considered to be eternal and to have no beginning. Since liberation is achieved through knowledge, Sāṅkhya stresses the importance and efficacy of knowledge over ritual and other religious endeavours.

Sāṅkhya is cognate to *saṅkhyā*, meaning 'to count' or 'enumerate'. Thus Sāṅkhya seeks to enumerate the basic facts of reality so that people will understand them and find liberation. Basic Sāṅkhyan models and terms appear in some Upaniṣads and underlie important portions of the epic *Mahābhārata*, especially the *Bhagavad Gītā* and *Mokṣadharma*. No distinct Sāṅkhyan text prior to Īśvarakṛṣṇa's *Sāṅkhyakārikā* (*c*.350–*c*.450) is extant. It enumerates and explains the twenty-five components and a subsidiary list of sixty topics (*ṣaṣtitantra*), which are then subdivided into further enumerative lists. Most of the subsequent Sāṅkhyan literature consists of commentaries and expositions of the *Sāṃkhyakārikā* and its ideas, which continued to be refined without major alterations well into the eighteenth century. Sāṅkhyan models strongly influenced numerous other Indian schools, including Yoga, Vedānta, Kashmir Shaivism and Buddhism.

DAN LUSTHAUS

SANTAYANA, GEORGE (1863–1952)

George Santayana was a philosopher, essayist, novelist and poet. Born in Spain, he moved to America as a child and attended Harvard, studying under William James and Josiah Royce. The philosophical world first took note of Santayana for his work in aesthetics. *The Sense of Beauty* (1896), his attempt to give a naturalistic account of the beautiful, remains influential. He wrote exquisitely crafted essays on literature and religion, viewing both as articulating important symbolic truths about the human condition. His mature philosophical system is a classical edifice constructed out of positions adopted from Plato and Aristotle, which he modified in light of the naturalistic insights of his beloved Lucretius and Spinoza and steeped in pessimism reminiscent of Schopenhauer. Although in close touch with the philosophical developments of his day, he always viewed human life and its problems in a calming cosmic perspective.

JOHN LACHS

SAPIR, EDWARD

See Sapir-Whorf hypothesis

SAPIR-WHORF HYPOTHESIS

The Sapir-Whorf hypothesis is a widely used label for the linguistic relativity hypothesis, that is, the proposal that the particular language we speak shapes the way we think about the world. The label derives from the names of American anthropological linguists Edward Sapir and Benjamin Lee Whorf, who persuasively argued for this idea during the 1930s and 1940s – although they never actually characterized their ideas as a 'hypothesis'. In contrast to earlier European scholarship concerned with linguistic relativity, their approach was distinguished by first-hand experience with native American languages and rejection of claims for the superiority of European languages.

JOHN A. LUCY

SARTRE, JEAN-PAUL (1905–80)

Introduction

Sartre was a philosopher of paradox: an existentialist who attempted a reconciliation with Marxism, a theorist of freedom who explored the notion of predestination. From the mid-1930s to the late 1940s, Sartre was in his 'classical' period. He explored the history of theories of imagination leading up to that of Husserl, and developed his own phenomenological account of imagination as the key to the freedom of consciousness. He analysed human emotions, arguing that emotion is a freely chosen mode of relationship to the outside world. In his major philosophical work, *L'Être et le Néant* (*Being and Nothingness*) (1943), Sartre distinguished between consciousness and all other beings: consciousness is always at least tacitly conscious of itself, hence it is essentially 'for itself' (*pour-soi*) – free, mobile and spontaneous. Everything else, lacking this self-consciousness, is just what it is 'in-itself' (*en-soi*); it is 'solid' and lacks freedom. Consciousness is always engaged in the world of which it is conscious, and in relationships with other consciousnesses. These relationships are conflictual: they involve a battle to maintain the position of subject and to make the other into an object. This battle is inescapable.

Although Sartre was indeed a philosopher of freedom, his conception of freedom is often misunderstood. Already in *Being and Nothingness* human freedom operates against a background of facticity and situation. My facticity is all the facts about myself which cannot be changed – my age, sex, class of origin, race and so on; my situation may

be modified, but it still constitutes the starting point for change and roots consciousness firmly in the world. Freedom is not idealized by Sartre; it is always within a given set of circumstances, after a particular past, and against the expectations of both myself and others that I make my free choices. My personal history conditions the range of my options.

From the 1950s onwards Sartre became increasingly politicized and was drawn to attempt a reconciliation between existentialism and Marxism. This was the aim of the *Critique de la raison dialectique* (*Critique of Dialectical Reason*) (1960) which recognized more fully than before the effect of historical and material conditions on individual and collective choice. An attempt to explore this interplay in action underlies both his biography of Flaubert and his own autobiography.

1 Background

Sartre's prestige as a philosopher was at its peak, in France at least, in the late 1940s, in the aftermath of the Second World War, when a philosophy of freedom and self-determination fitted the mood of a country recently liberated from the Occupation. It was at its nadir in the late 1960s and 1970s when structuralism had discredited, temporarily, both humanism and existentialism, and proclaimed 'man' to be no more than a locus of forces traversed and indeed produced by social and linguistic structures (see STRUCTURALISM). The British analytic tradition has never had much time for the literary and dramatic aspects of existentialism and phenomenology, though some recent critics, such as Phyllis Morris and Gregory McCulloch, have attempted to take Sartre seriously as a philosopher and to assess his contribution in terms more accessible to analytically trained minds.

The emotive responses tend in their different ways to distort Sartre's arguments and to focus, for example, on one of the poles of the many paradoxes which his philosophy implies. For Sartre is indeed a philosopher of paradox – deliberately facing his readers with logically 'impossible' or self-contradictory statements in order to force them to think beyond the confines of the binary oppositions to which common sense and analytic reason have accustomed them. For example, 'Man is what he is not and is not what he is' (1943: 97) provocatively compels the reader who perseveres to confront the difficult issues of the relationship between essence, existence and negation. 'Man is what he is not', that is to say, man is a being without an essential nature, a being who operates through negation, who cannot be identified with his past, or indeed his present self, and so 'who is not what he is'.

The Paris of the 1940s overestimated Sartre's faith in human freedom and lauded him for it; 1960s Paris made the same mistake and discarded him along with all other relics of mid-century humanism. Neither period read Sartre carefully enough to recognize the constraints and limits within which freedom was, from the outset, deemed to operate.

2 Early philosophy

Sartre's first published philosophical works were *L'Imagination* (1936), a history of theories of imagination up to the theory of Edmund HUSSERL, and 'La Transcendance de l'ego' (*The Transcendence of the Ego*) (1936). *The Transcendence of the Ego* shows hostility to any kind of essentialism of the self. In it Sartre argues (against Husserl) that the ego is not transcendental but transcendent, that is, it is not an inner core of being, a source of my actions, emotions and character, but rather a construct, a product of my self-image and my image in the eyes of others, of my past behaviour and feelings. Sartre maintains that consciousness is not essentially first-person but is impersonal, or at most pre-personal, and that it is characterized by intentionality, that is to say it is always directed at something other than itself. In this context Sartre positions himself in relation to the Kantian 'unity of apperception', arguing that although the 'I think' must be able to accompany all my representations, it does not always do so, at least explicitly. I may turn my attention at any moment away from what I am doing and direct it towards myself as agent, but this reflexivity is not a permanent, thetic feature of consciousness. Later, in *L'Être et le Néant* (Being and Nothingness) (1943), Sartre claims that it is precisely this very reflexivity – the self-consciousness of consciousness – that personalizes consciousness and constitutes the human subject, but in *The Transcendence of the Ego* such a notion is absent and he is more concerned to argue against the identification of consciousness with selfhood than to explore the ways in which consciousness relates to the notion of subject.

In his *Esquisse d'une théorie des émotions* (*Sketch for a Theory of Emotions*) (1939) Sartre turns his attention to another area of human experience in order to show that this, in its turn, cannot be described in essentialist terms. Emotions, in Sartre's account, are chosen rather than caused: emotion involves a 'magical' attempt to transform reality by

changing what can be changed (my own feelings) rather than what is less easily malleable, that is, the outside world. In the face of extreme danger I may faint from fear: the danger has not disappeared but I am no longer conscious of it. Sartre here takes a radical position which he maintained but modified in later years, as his recognition of the degree to which we are formed by external conditions gradually increased. He is careful to distinguish between various areas related to emotion – passion, feeling and so on. Emotion is not sustainable continuously through time, but is subject to fluctuations of intensity, and may at times be replaced by alternative feelings. In this sense too Sartre rejects essentialism: like Proust he believes in the 'intermittances of the heart': love, for example, is not a continuous emotional state, but an amalgam of affection, desire, passion, as well as, perhaps, jealousy, resentment and even occasionally hatred. Love is not the permanent compelling state we may like to imagine: it is the product of a decision and a commitment (see EMOTIONS, NATURE OF; EMOTIONS, PHILOSOPHY OF).

These two works form the grounding for Sartre's early theory of human freedom along with a second work on the imagination. In *L'Imaginaire, psychologie phénoménologique de l'imagination* (*The Psychology of the Imagination*) (1940) Sartre picks up the threads of Husserl's theory of imagination and develops it further by showing how phenomenological psychology works in practice. Unlike traditional empirical psychology it is not based in a positivist methodology in which evidence depends on an accumulation of examples. The phenomenological method operates through a particular type of introspection or intuition in which the phenomenologist examines a single example, or a series of examples, of the phenomenon to be analysed (here imagination) and deduces from the example the general principles and features of the phenomenon. In this way Sartre describes what he calls the 'poverty' of the image – the fact, that is, that I can never find in it any more than I have already put there. If, say, I do not know the number of columns in the Parthenon, I can count them if I look at the temple in reality; if I merely imagine the temple the number of pillars will depend not on the real building but merely on my own implicit estimate. I cannot learn anything from imagination as I can from perception. But the reverse of this 'poverty' of the imagination is its *freedom* – in imagination I am not constrained as I am in perception by the material world around me. Indeed, imagination is not merely image formation – in Sartre's account it is itself constitutive of the freedom of consciousness. Without imagination we would be 'stuck in the real', unable to escape from the present moment of time and our immediate surroundings. It is imagination that allows us to step back from our material environment and take up an (imaginary) distance from it, in Sartre's terms to 'totalize' it, to see it as a 'world' with order and pattern. In *Being and Nothingness* Sartre will also maintain that the imagination is the source of the purpose and finality we see in the world, but *The Psychology of the Imagination*concentrates rather on the different functions of imagination and image formation in the narrower sense (see IMAGINATION).

3 Being and Nothingness

Being and Nothingness sets out the main philosophical tenets of the 'classical' Sartre. Being is subdivided, as it were, into two major regions – being for-itself (*l'être pour-soi*) or consciousness, and being-in-itself (*l'être en-soi*) which is everything other than consciousness, including the material world, the past, the body as organism and so on. To being-in-itself Sartre devotes no more than six of his 660 pages; there is little to be said about it other than it is, it is what it is, and it is 'in itself'. Only through the 'for-itself' of consciousness does the 'in-itself' become a world to speak of. Indeed, Sartre argues, we cannot know anything about being as it is, only about being as it appears to us. It is through consciousness that the world is endowed with temporality, spatiality and other qualities such as usefulness. This is where the imagination in its broadest sense may be seen as primary: 'imagination is the whole of consciousness as it realizes its freedom' ('L'Imaginaire, psychologie phénoménologique de l'imagination' 1940: 236). Imagination makes a world of the 'in-itself', it totalizes and 'nihilates' it. Nihilation (*néantir*) is a term that is specific to Sartre, and means not annihilation but rather the special type of negation that consciousness operates when it 'intends' an object: it differentiates the object from its surroundings and knows itself *not* to be that object. But consciousness is not alone in the world it has created from the brute 'in-itself', indeed it has not created the world individually, but rather as part of an intersubjective community. And other people, or their consciousnesses, are not an afterthought for Sartre. Like HEIDEGGER he sees man as always already engaged in relationships with others; unlike Heidegger he sees these not in terms of *Mitsein* (Being-with), but in terms of conflict in a manner reminiscent of the account given by HEGEL of the relationship between masters and slaves. The other is in permanent competition with me. I wish to be a subject and make of the other an object, while he or she attempts to make me an object in my turn. In Sartre's account, this battle is the key to all human

relationships, and not merely those which might appear conflictual, but also those of sexual desire and even love. Consciousness is engaged in a permanent struggle to maintain its freedom in the face of onslaughts from all sides.

These aspects of Sartre's early philosophy are probably the best known. Less familiar but no less significant are his accounts of the limits within which human freedom operates. The battle of consciousnesses is not disembodied, and my own body constitutes not only the condition of possibility but also one of the major constraints on my freedom. Consciousness and imagination are free, but they are free against a background of facticity and situation. Facticity in particular is rarely given due weight by exegetes of Sartre's philosophy. My facticity is all the facts about myself which cannot be changed – my age, sex, height, class of origin, race, nationality, for example. (Later Sartre comes to include in facticity more psychological elements of genetic or environmental origin.) One's situation may be modified, but it still constitutes the starting point for any change, and roots consciousness firmly in the world about it. All this means that the Sartrean philosophy of freedom is less idealized than it might at first appear. I am not free to change a whole multiplicity of aspects of my condition, and those I am free to change may not prove easy. As I live I create a self which does not bind me but which certainly makes some courses of action easier and more attractive than others. My own self-image and the image others hold of me also condition the range of possibilities open to me. I make a character for myself over the years, and though it is always open to me to act 'out of character' – after all it is a self I have constituted, not an essence I was born with – such a decision is not usually easy. Sartre describes this self-constitution in terms not so much of character as of 'project', each person having a fundamental project of being, which is not necessarily the result of a conscious decision, and possibly elaborated gradually over time. This project forms the core of a whole nexus of choices and behavioural decisions which form the totality that constitutes my self. My actions form a meaningful whole, each act relates to others before and since, and so the decision to make significant changes always comes up against resistance from already existent patterns and structures. Discussing, for example, an episode when a man gives up on a long hike declaring he is 'too tired' to continue, Sartre discusses the abandonment of the walk in terms of a project which does not put persistence in the face of setbacks at much of a premium. He 'could have acted differently, of course,' Sartre comments, 'but at what cost?' (1943: 531). Our personal history does not eradicate our freedom, but in practice it is often easier to deny our freedom than to employ it. We hide behind the selves we have constructed, fearing change and convincing ourselves that our choices are limited. Freedom is threatening to us, it opens up a range of possibilities which we find daunting, and we flee from it in what Sartre calls 'bad faith'. Ideally we would like the positive aspect of liberty – free choice, a lack of constraints – together with the security and comfort of a fixed character or nature. The two are incompatible, and our desire to combine them is termed by Sartre a 'useless passion' (see SELF-DECEPTION, ETHICS OF).

In 1943, then, Sartre already sets freedom firmly against a background of constraint – constraints which arise from the features of the material world, from other people whose projects may not coincide with mine, from bodily existence, from facticity and from fear of freedom itself. Freedom is always within and starting from situation, and it is on the determinants and conditioning power of situation that Sartre increasingly focuses in his later writings.

4 Literary works

The 1940s were the period of Sartre's most prolific literary production. From *La Nausée* (*Nausea*) (1938) which explores the relationship of contingency and necessity in life and art through the experiences of Roquentin, Sartre moves on in the war years to a contemporary trilogy *Les Chemins de la liberté* (The Roads to Freedom) (1945–9). The trilogy (or unfinished quadrology?) portrays the lives of a varied group of Parisian intellectuals at the outbreak of war, and in particular the ways in which they hide their freedom from themselves while convincing themselves that it is their ultimate goal. Mathieu, a university academic, is the main focus for such ambivalence as he tries to find money for an abortion for his long-term mistress Marcelle.

Sartre also wrote several very successful plays in this period – *Les Mouches* (*The Flies*) (1943), a wartime allegory of resistance to German occupation, which uses the Orestean myth to explore the power of human liberty in the face of oppression. *Huis Clos* (*In Camera*) (1944) shows the deadly consequences of conflictual human relations and self-deception in a hell comprising three characters doomed to remain together for ever in a Second Empire drawing room. *Les Mains Sales* (*Dirty Hands*, or *Crime Passionel*) (1948) debates the issues of realism and idealism, means and ends, truth, lies and political commitment in Illyria, an imaginary communist country in Eastern Europe. This finely balanced and complex play received an

unexpectedly positive response from the bourgeois press who interpreted it, against Sartre's intentions, as predominantly anti-communist. In consequence Sartre felt obliged to ban its production for about ten years.

5 Later philosophy

The increasing politicization of Sartre's postwar writing meant that he left both literature and philosophy to one side in the 1950s as he became increasingly engaged as a writer, lecturer and public figure in concrete political issues and endeavours. His next major philosophical work, the *Critique de la raison dialectique* (*Critique of Dialectical Reason*), did not appear until 1960 and is clearly marked by his increasing intellectual engagement with Marx. The *Critique* is an attempt to do the impossible: to reconcile existentialism and Marxism; to revivify Marxism, which Sartre believed was becoming sclerotic, by reawakening its awareness of individual and collective subjectivity; and to bring existentialism into closer contact with the material conditions of historical existence. Sartre examines social and political issues such as group action, historical change, revolution and behaviour in the face of material scarcity of resources. He modifies his radical position on the extent of human freedom by recognizing more fully than before the effect of historical and material conditions on individual and collective choice. He takes as his own the famous slogan of Engels: 'Men make history on the basis of what history has made them'. We are not pawns or cogs in a machine, nor do we simply participate in processes of internalization and externalization: we are free agents, but agents who are profoundly and inescapably situated in specific social and material conditions. Indeed Sartre later uses the (Jansenist) term 'predestination' to explain how his views differ from positivist theories of human determinism. Material conditions set up the environment in which we operate. They do not causally determine our behaviour, but they do prescribe the (limited) range of options open to us. A white bourgeois male in a prosperous suburb has a vastly wider range of choices on which to exercise his freedom than an elderly black women living in the poverty of an inner city ghetto. Both are free in the ontological sense, but their possibilities for making use of that freedom are not comparable. And in 1960 Sartre is as concerned with the restrictions imposed on freedom by the material world as with human liberty itself.

It is this preoccupation with the absolute and yet circumscribed nature of human freedom that underpins Sartre's two last major works: his autobiography, *Les Mots* (*Words*) (1963), a brief and finely wrought literary masterpiece, and *L'Idiot de la famille* (*The Idiot of the Family*) (1971–2), a 3,000-page biography of Flaubert which draws on a vast range of different disciplines. 'What can one know of a man, today?' was the question Sartre set out to answer in his account of Flaubert, and in it he synthesizes not only existentialism, phenomenology and Marxist theory and method, but also psychoanalysis, sociology, history of literature, aesthetics and anthropology. What did Flaubert make of what was made of him? Educated in a family embodying the historical conflicts of its age, second son of a doctor and expected to become a lawyer, the young Gustave Flaubert constructed a very different career for himself. Resistant to adult pressures to perform, he learned to read late (hence the *Idiot* of the title), lived in his elder brother's shadow and opted out of law school through a hysterico-epileptic crisis ('intentional' but not 'deliberate', in Sartre's terms) which made him an invalid – the 'hermit of Croisset' – and thus permitted him to live in the family home and become a writer. Sartre's account of his own choice of the same career is more succinct and more ironic: the Sartre and Schweitzer (maternal grandfather) families are not spared in the biting and witty descriptions of the 'family comedy' which made of young Jean-Paul a precocious charlatan, writing to please adults, writing for future fame – a superman author – and finally writing as a professional. The gap between choice and destiny is shown to be very small, but it has not closed. Even when analysing with cruel perspicacity his own formation, Sartre maintains the framework he set up thirty years earlier: freedom within situation, even when the situation may leave little room for manoeuvre. Subjectivity is now defined as the *décalage* or difference between the processes of internalization and externalization; liberty may be no more than the 'play' in the mechanism, but the permanent dialectic between the poles of freedom and conditioning remains untotalized.

CHRISTINA HOWELLS

SAUSSURE, FERDINAND DE (1857–1913)

Though he made a major contribution to the comparative and historical studies which dominated nineteenth-century linguistics, Saussure is best known today for the development of a radically different conception of language and of the methodology of linguistics which became central to twentieth-century structural linguistics. According to this conception a language is a system of signs which are radically arbitrary, so that their significations are determined only by the historically constituted systems of conventions to which they belong – such a system Saussure called '*la langue*'. It follows, therefore, that a linguistic study is first and foremost one of *la langue*, that is, of the conventional relations obtaining at a given time between signs belonging to the same system, rather than one of the development of linguistic forms over time, as the comparativists had maintained.

DAVID HOLDCROFT

SCEPTICISM

Introduction

Simply put, scepticism is the view that we fail to know anything. More generally, the term 'scepticism' refers to a family of views, each of which denies that some term of positive epistemic appraisal applies to our beliefs. Thus, sceptical doctrines might hold that none of our beliefs is certain, that none of our beliefs is justified, that none of our beliefs is reasonable, that none of our beliefs is more reasonable than its denial, and so on. Sceptical doctrines can also vary with respect to the kind of belief they target. Scepticism can be restricted to beliefs produced in certain ways: for example, scepticism concerning beliefs based on memory, on inductive reasoning or even on any reasoning whatsoever. And sceptical views can be restricted to beliefs about certain subjects: for example, scepticism concerning beliefs about the external world, beliefs about other minds, beliefs about value and so on. Solipsism – the view that all that exists is the self and its states – can be seen as a form of scepticism based on the claim that there are no convincing arguments for the existence of anything beyond the self.

The philosophical problem of scepticism derives from what appear to be very strong arguments for sceptical conclusions. Since most philosophers are unwilling to accept those conclusions, there is a problem concerning how to respond to the arguments. For example, one kind of sceptical argument attempts to show that we have no knowledge of the world around us. The argument hinges on the claim that we are not in a position to rule out the possibility that we are brains-in-a-vat being artificially stimulated to have just the sensory experience we are actually having. We have no basis for ruling out this possibility since if it were actual, our experience would not change in any way. The sceptic then claims that if we cannot rule out the possibility that we are brains-in-a-vat, then we cannot know anything about the world around us.

Responses to this argument often fall into one of two categories. Some philosophers argue that we can rule out the possibility that we are brains-in-a-vat. Others argue that we do not need to be able to rule out this possibility in order to have knowledge of the world around us.

1 The philosophical problem of scepticism

Most contemporary discussions of scepticism have focused on scepticism concerning the external world. We can use this type of scepticism to illustrate the broader philosophical problem, as many of the arguments we consider can be applied *mutatis mutandis* to other types of scepticism.

One type of scepticism denies that we know anything about the external world. The view is not simply that, for example, by gathering more evidence we could come to know. Rather, it is that we are unable to attain knowledge. On the plausible assumption that knowledge entails justified belief, scepticism concerning knowledge follows from scepticism concerning justified belief – the view that justified belief about the external world is unattainable.

Scepticism is of philosophical interest because there appear to be very strong arguments that support it. This presents us with the problem of how to respond to these arguments. One way would be to accept their conclusion. Of course, very few philosophers are willing to do this. There are very few actual sceptics. So the problem of scepticism is how to refute or in some way neutralize or deflate the force of these arguments.

In the history of philosophy, some sceptical arguments have been based on the unreliability or relativity of our senses (see PYRRHONISM), or upon the inability of reason to produce non-question begging arguments for our beliefs (see HUME, D.). Nearly all sceptical arguments exploit sceptical hypotheses or alternatives. Sceptical alternatives suppose that the world is very different from what we would normally believe on the basis of our sensory evidence. This entails that our sensory evidence is radically misleading. More precisely, suppose we claim to know a proposition q on the basis of evidence e. Let (proposition) h be an *alternative* to q just in case h is incompatible with q (q and h cannot both be true). Then h is a *sceptical alternative* to q provided h is an alternative to q compatible with e. An alternative of this kind has sceptical force precisely because it is compatible with the evidence we claim gives us knowledge of q. For example, ordinarily, I would claim to know on the basis of my visual evidence that I am currently looking at my computer monitor. One sceptical alternative, introduced by Descartes, is that the world of familiar objects does not exist and that I am being deceived into thinking it does by a powerful demon. The demon causes me to have just the sensory experiences I would have if the world of familiar objects existed (see DESCARTES, R. §4). According to a modern version of this alternative, I am a brain-in-a-vat being artificially stimulated to have all the experiences I would have if I had a body and interacted, in the normal way, with the world of familiar objects. These alternatives are incompatible with what I claim to know about the familiar world around me since according to those alternatives, that world does not exist. Moreover, since these alternatives entail that it appears to me as if that world exists, they are compatible with my evidence.

Sceptical alternatives provide the basis for very powerful sceptical arguments. Exactly how they do this is a matter of some controversy. The quickest route to scepticism is through what I will call the entailment principle:

S knows q on the basis of (evidence) e only if e entails q.

Since a sceptical alternative is, by definition, a proposition incompatible with q but compatible with e, it follows from the mere existence of sceptical alternatives of the kind we have been considering that we do not know those empirical propositions we ordinarily claim to know. But, this argument is only as good as the entailment principle. Should we accept this principle? In effect, the principle says I can know p only if my evidence precludes the possibility of error. Though many philosophers concede that this principle has considerable intuitive force, most have thought, in the end, that it should be rejected. This position is sometimes called fallibilism (see COMMONSENSISM; FALLIBILISM). Of course, few philosophers believe that scepticism should be avoided at all costs. But when given a choice between scepticism and fallibilism, most philosophers opt for fallibilism (at the expense of the entailment principle).

Does fallibilism beg the question against scepticism? After all, precisely what the sceptic claims is that the existence of alternatives consistent with our evidence undermines our claims to know. Fallibilists merely respond that the alternatives the sceptic has invoked do not undermine our knowledge claims: that is, we can know even when there are such alternatives. Since this is the point at issue, fallibilists seem to need an argument in support of this crucial claim.

Here, fallibilists can appeal to our strong intuition that in many cases we do know things, despite the existence of sceptical alternatives. And it is not clear that the sceptic can undermine those intuitions except by appealing to the entailment principle – which is itself undermined by those very intuitions. Thus neither side of the debate may be able to defend its position without begging the question.

Unfortunately scepticism is not so easily dispatched. The sceptic can turn the appeal to our ordinary intuitions against fallibilism. For some of those intuitions can provide the basis for a new sceptical argument. This argument begins by claiming, quite plausibly, that whatever else we may say about the significance of sceptical alternatives, we cannot claim, plausibly, to know they are false. For example, we cannot claim, plausibly, to know that we are not brains-in-a-vat being artificially stimulated to have exactly the same experience we would have as normal human beings. None of our evidence counts against this hypothesis since if it were true, we would have precisely that evidence.

But how, exactly, does this permit the sceptic to conclude we do not know the propositions we ordinarily claim to know? At this point, the sceptic appeals to a very intuitive principle that is weaker than the entailment principle. This principle says

that the set of known (by *S*) propositions is closed under known (by *S*) entailment:

If *S* knows *q*, and *S* knows that *q* entails not-*h*, then *S* knows not-*h*.

While one could quibble with some details about this principle, it (or something very much like it) seems compelling (see Deductive closure principle). From this principle and the claim that we fail to know sceptical alternatives are false, it follows that we fail to know the propositions we ordinarily claim to know (since we know those propositions entail the falsity of sceptical alternatives).

2 Responses to scepticism

This argument presents problems for fallibilism, as I have characterized it, since the argument at no point presupposes the entailment principle. The sceptical argument we are now considering merely exploits the fallibilist position that permits the existence of alternatives to known propositions.

Fallibilist responses come in two forms, each of which corresponds to the denial of one of the two premises of the sceptical argument. One response denies the closure principle. For example, Dretske has argued that the fact that we do not know the falsity of sceptical alternatives shows that the closure principle is false, since we do know the truth of many empirical propositions that (we know) entail the falsity of sceptical alternatives. According to this view, certain alternatives are not relevant to whether one knows a proposition: one does not have to know such an alternative to *q* is false in order to know *q*. So, for example, one can know that one sees a zebra without knowing that the alternative – that one sees a cleverly disguised mule – is false, because that alternative is not relevant. This version of fallibilism is sometimes called the 'relevant alternatives' view.

The other fallibilist response to the sceptical argument agrees with the sceptic that the closure principal is true. But, against the sceptic, these fallibilists deny the claim that we fail to know the falsity of sceptical alternatives. One version of this fallibilist response uses the closure principle along with the claim that we do have knowledge, to reject the claim that we do not know that sceptical alternatives are false. They argue from the premise that we know some ordinary proposition *q* and the premise that if we know *q* then we know any proposition that we know is entailed by *q* (the closure principle), to the conclusion that we know that we are not seeing a cleverly disguised mule. We can call this view '*modus ponens* fallibilism'.

3 Relevant alternatives fallibilism

As we have noted, the sceptic attempts to undermine our claims to know by calling attention to sceptical alternatives. The relevant alternatives response to this sceptical manoeuvre is to deny that these alternatives are relevant. An alternative, *h*, to *q*, is relevant just in case we need to know *h* is false in order to know *q*. So if *h* is not a relevant alternative, we can still know *q* even if we fail to know *h* is false. This view entails that the deductive closure principle is false.

There are two ways to argue for this view. The direct way is to cite alleged counterexamples to the deductive closure principle. Some philosophers have done this by appealing both to our intuition that we know many propositions about the external world and to our intuition that we fail to know the falsity of sceptical alternatives. So my strong intuition that I know I am looking at my computer monitor and my strong intuition that I fail to know I am not a brain-in-a-vat constitute the basis for such a counterexample.

A more indirect way to argue for this view is to construct a theory of knowledge that has as a consequence the failure of the closure principle, as in Nozick. The basic idea of these kinds of theories is that knowing requires the truth of certain subjunctive conditionals. On one (simplified) version, my knowing *q* requires that:

(*S*) If *q* were false, I would not believe *q*.

This requirement for knowledge precludes my knowing I am not a brain-in-a-vat. For I would still believe I am not a brain-in-a-vat, even if I were a brain-in-a-vat. But, this requirement allows me to know I see a computer monitor. For it seems plausible to claim that I would not believe I see the computer monitor if I were not seeing it.

A significant difficulty for the direct way of arguing for the relevant alternatives view – the appeal to counterexamples to the closure principle – is that the intuitions that support the counterexamples seem no more compelling than the intuitions in favour of the closure principle. Many think that the closure principle expresses a fundamental truth about our concept of knowledge. So much so that if a certain theory of knowledge entails the falsity of the closure principle, some philosophers are inclined to take the fact as a *reductio ad absurdum* of that theory.

But this presents problems for the indirect way of arguing for the relevant alternatives view: some philosophers reject theories that endorse condition (*S*), for the very reason that it entails the falsity of the closure principle. Moreover, there are other difficulties for theories that endorse conditions like

(*S*). One problem for these theories is that they seem to preclude our knowing much of what we take ourselves to know inductively. Consider an example where you leave a glass containing some ice cubes outside on an extremely hot day. Several hours later, while you are still inside escaping the heat, you remember the glass you left outside. You infer that the ice must have melted by now. Here we have an ordinary case of knowledge by inductive inference. According to the theories we are now considering, my knowing that the ice cubes have melted requires the truth of this subjunctive conditional:

(*S′*) If the ice cubes had not melted, I would not believe that they had.

But (*S′*) looks false. It seems plausible to claim that had the ice cubes not melted, it might have been for some reason (for example, someone putting them in a styrofoam cooler) that would still leave me believing they had melted. Thus, it looks as if theories which endorse this condition are too strong. If this is correct, then the anti-sceptical results afforded by condition (*S*) come at the cost of scepticism about certain kinds of inductive knowledge.

We should note, however, that there is some controversy over the evaluation of subjunctive conditionals like (*S′*). But I think it is fair to say that standard semantics for subjunctive conditionals would render (*S′*) as false (see DEDUCTIVE CLOSURE PRINCIPLE).

4 Modus ponens *fallibilism*

Modus ponens fallibilists accept, along with the sceptic, the deductive closure principle. But they attempt to turn that principle against the sceptic. Like relevant alternatives fallibilists, they take as a starting point the strongly intuitive claim that we do know many things about the world. They then note that, given the closure principle, it follows that we know the falsity of sceptical alternatives. For example, I now know that I am looking at my computer monitor. I also know that my looking at a computer monitor precludes my being a brain-in-a-vat. It follows by the closure principle that I know I am not a brain-in-a-vat.

Is this piece of reasoning legitimate? One might challenge those who reason in this way to explain how we know sceptical alternatives are false. How, for example, do I know I am not a brain-in-a-vat? After all, the sceptical problem arises because we seem to lack any reason for believing sceptical alternatives are false. These alternatives are constructed so as to make it impossible for our evidence to count against them. Presumably, our recognition of this explains, at least in part, our intuition that we fail to know that sceptical alternatives are false.

One way for the *modus ponens* fallibilist to try to meet this challenge is to claim that I can know:

not-*h*: I am not a brain-in-a-vat

by inferring it from:

q: I am looking at my computer monitor

According to this way of proceeding, even though none of my evidence for *q* counts in favour of not-*h*, it does not follow that I have no reason to believe not-*h*. For *q* itself can be that reason. Since I know *q* (on the basis of my visual evidence) and I know that *q* entails not-*h*, I can infer not-*h* from *q* and thereby come to know not-*h*.

Is this reasoning legitimate? Let's compare it with another case. Suppose I park my car in front of the market and go inside. Although I am not currently looking out the window I can still know:

p: My car is parked in front of the store

Can I then come to know:

r: My car has not been towed away

simply by inferring it from *p*? Notice that *p* entails *r*. It seems, none the less, that I would already need to have sufficient evidence to know *r* before I could infer *p*. And if my initial evidence is insufficient for me to know *r*, I cannot infer *p* and so I cannot infer *r* from *p*.

The *modus ponens* fallibilist reasoning concerning sceptical alternatives looks suspicious because it seems like the reasoning in the parked car case. Intuitively, I need to have reason to believe not-*h* before I can infer (and thereby come to know) *q*. Thus I cannot first infer *q* and then go on to infer (and thereby come to know) non-*h*.

Another version of fallibilism argues for the claim that we know sceptical alternatives are false by appealing to principles of inductive inference. One version of this view argues that the hypothesis that the familiar world of objects exists is the best explanation of our sensory evidence (and so a better explanation than sceptical alternatives). This licenses an inference from our sensory evidence to the familiar-world hypothesis (see INFERENCE TO THE BEST EXPLANATION). We can thereby come to know that this familiar world exists. And since we know that the familiar-world hypothesis rules out the sceptical alternatives, it follows by the closure principle that we know that sceptical alternatives are false.

The burden for this view is to say why the familiar-world hypothesis is a better explanation of our sensory evidence than any sceptical alternative. This is not easy to do since sceptical alternatives are designed to explain our sensory evidence. Proponents of the view that sceptical alternatives provide inferior explanations often appeal to pragmatic considerations like simplicity and conservatism. But there are several problems with this approach. Even if we could establish that the familiar-world hypothesis is, for example, simpler than any sceptical alternative, why should we think that this supports the claim that the hypothesis is true? Unless this crucial link can be made, it is not clear how this response to the sceptic can succeed (see Theoretical (epistemic) virtues).

Moreover, often arguments that the familiar-world hypothesis is the best explanation of our sensory data are quite sophisticated and complex. This raises the worry that only those who are philosophically sophisticated enough to follow such an argument can have knowledge of the external world.

5 The role of intuitions

Many fallibilist responses to the sceptic take as their starting point our ordinary intuitions about knowledge or our everyday pattern of knowledge attributions. But how exactly can our everyday pattern of knowledge attributions have force against sceptical arguments, since the sceptic is calling into question precisely these attributions?

The reason our ordinary intuitions about knowledge have force against the sceptic is that these intuitions persist even in the face of sceptical arguments. When we confront a sceptical argument, even though we may not be able to say where the argument goes wrong, we are reluctant to withdraw our everyday knowledge attributions. This is the basis of G.E. Moore's famous response to sceptical arguments. Moore claimed to be more sure that he knew some things, for example, that he has a hand, than he is that the sceptical argument is sound. So even though he could not say where the sceptical argument goes wrong, he thought it more rational to suppose that there is a mistake in the sceptical argument than to suppose that the conclusion of the argument – we fail to know anything – is true (see Moore, G.E.; Commonsensism).

The sceptic could try to dismiss the significance of our reluctance to withdraw our everyday knowledge attributions as nothing more than the persistence of old habits. This persistence of our habitual ways of thinking about knowledge even after we have been confronted with sceptical arguments was noticed by Descartes and by Hume. But in response, we can note that, often, we find our everyday pattern of knowledge attributions compelling even while we are in the midst of sincere philosophical reflection. The fact is that when we think about sceptical arguments, we often find ourselves pulled in two directions. We feel the pull of the sceptical argument and yet we remain reluctant to give up our claims to know. This phenomenon cannot be dismissed as nothing more than an unreflective habit. So the fallibilist can maintain that our everyday knowledge attributions reflect deep-seated intuitions about our concept of knowledge. Since our intuitions are a kind of data that any theory of knowledge must explain, they present a formidable challenge to the sceptical position.

Nevertheless, there is something unsatisfying about rejecting scepticism just because it conflicts with our intuitions about knowledge. For, again, it is hard to deny the force of the sceptical argument. And just as our intuitions about our everyday knowledge attributions present a problem for scepticism, so our sceptical intuitions present a challenge to our everyday knowledge attributions. If scepticism is a strongly counterintuitive view, then why do sceptical arguments have any grip on us at all? Why do we not immediately respond to sceptical arguments by objecting, for example, that sceptical hypotheses are too remote and fanciful to undermine our knowledge claims? (Either we can know that sceptical alternatives are false or we need not know they are false in order to know things about the external world.) Sometimes we are inclined to do just that. But the sceptical problem arises precisely because we cannot always sustain that attitude. Sometimes, when we consider sceptical arguments, we begin to worry that sceptical alternatives really do threaten our knowledge claims.

What we are confronting here is a paradox – a set of inconsistent propositions, each of which has considerable independent plausibility:

(1) We know some ordinary empirical propositions.
(2) We do not know that sceptical alternatives are false.
(3) If S knows q, and S knows that q entails not-h, then S knows not-h.

One of these propositions must be false (on the assumption that we know q entails not-h). Yet each of them is very difficult to deny. This is what explains our vacillation over scepticism. The arguments for scepticism and for fallibilism attempt to exploit the intuitions favourable to them. The sceptic appeals to (2) and (3), and concludes that (1) is false. Relevant alternatives fallibilism appeals to

(1) and (2), and concludes that (3) is false. *Modus ponens* fallibilism appeals to (1) and (3), and concludes that (2) is false. Because each member of the set has independent plausibility, it seems arbitrary and unsatisfying to appeal to any two members of this triad as an argument against the third. Such a strategy does not provide what any successful resolution of a paradox should provide, namely an explanation of how the paradox arises in the first place. Any satisfying resolution of the paradox that defends our claims to know against the sceptic must explain the appeal of sceptical arguments. For it is that very appeal that gives rise to the paradox.

This is where Moore's response to the sceptic goes wrong. Many philosophers think that Moore begged the question against scepticism. In a way he did, but no more so than the sceptic begs the question against him. Still, there is something quite unsatisfying, philosophically, about Moore's treatment of the sceptical argument. But the problem with it is not that it begs the question against the sceptic. Rather the problem is that it fails to explain the dialectic force of sceptical arguments. Though it is possible that the apparent cogency of sceptical arguments is explained by some very subtle error in our reasoning, the simplicity of these arguments suggests that their appeal reveals something deep and important about our concept of knowledge. That is why we can learn much about the nature of knowledge by grappling with the problem of scepticism.

SCHELER, MAX FERDINAND (1874–1928)

Max Scheler, usually called a phenomenologist, was probably the best-known German philosopher of the 1920s. Always an eclectic thinker, he was a pupil of the neo-idealist Rudolph Eucken, but was also strongly influenced by the life-philosophies of Dilthey and Bergson. While teaching at Jena he regularly met Husserl, the founder of the phenomenological movement, and his mature writings have a strongly phenomenological, as well as a Catholic, stamp. Later he turned towards metaphysics and the philosophical problems raised by modern science.

Scheler's interests were very wide. He tried to do justice to all aspects of experience – ethical, religious, personal, social, scientific, historical – without doing away with the specific nature of each. Above all, he took the emotional foundations of thought seriously. Many of his insights are striking and profound, and sometimes his arguments are very telling, but his power to organize his material consistently and to attend conscientiously to the business of justification is poorly developed.

Scheler is best known for his anti-Kantian ethics, based on an a priori emotional grasp of a hierarchy of objective values, which precedes all choice of goods and purposes. He himself describes his ethics as 'personalist', and makes personal values supreme, sharply distinguishing the 'person' from the 'ego', and linking this with his analysis of different types of social interaction. In epistemology he defends a pragmatist approach to science and perception; thus philosophy, as the intuition of essences, requires a preparatory ascetic discipline. His philosophy of religion is an attempt to marry the Augustinian approach through love with the Thomist approach through reason. In his later work, to which his important work on sympathy provides the transition, he defends a dualist philosophical anthropology and metaphysics, interpreting the latter in activist terms as a resolution of the tensions between spiritual love and vital impulse.

FRANCIS DUNLOP

SCHELLING, FRIEDRICH WILHELM JOSEPH VON (1775–1854)

Like the other German idealists, Schelling began his philosophical career by acknowledging the fundamental importance of Kant's grounding of knowledge in the synthesizing activity of the subject, while questioning his establishment of a dualism between appearances and things in themselves. The other main influences on Schelling's early work are Leibniz, Spinoza, J.G. Fichte and F.H. Jacobi. While adopting both Spinoza's conception of an absolute ground, of which the finite world is the consequent, and Fichte's emphasis on the role of the I in the constitution of the world, Schelling seeks both to overcome the fatalism entailed by Spinoza's monism, and to avoid the sense in Fichte that nature

only exists in order to be subordinated to the I. After adopting a position close to that of Fichte between 1794 and 1796, Schelling tried in his various versions of *Naturphilosophie* from 1797 onwards to find new ways of explicating the identity between thinking and the processes of nature, claiming that in this philosophy 'Nature is to be invisible mind, mind invisible nature'. In his *System des transcendentalen Idealismus* (System of Transcendental Idealism) (1800) he advanced the idea that art, as the 'organ of philosophy', shows the identity of what he terms 'conscious' productivity (mind) and 'unconscious' productivity (nature) because it reveals more than can be understood via the conscious intentions that lead to its production. Schelling's 'identity philosophy', which is another version of his *Naturphilosophie*, begins in 1801, and is summarized in the assertion that 'Existence is the link of a being as One, with itself as a multiplicity'. Material nature and the mind that knows it are different aspects of the same 'Absolute' or 'absolute identity' in which they are both grounded. In 1804 Schelling becomes concerned with the transition between the Absolute and the manifest world in which necessity and freedom are in conflict. If freedom is not to become inexplicable, he maintains, Spinoza's assumption of a logically necessary transition from God to the world cannot be accepted. *Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände* (Of Human Freedom) (1809) tries to explain how God could create a world involving evil, suggesting that nature relates to God somewhat as the later Freud's 'id' relates to the developed autonomous 'ego' which transcends the drives which motivate it.

The philosophy of *Die Weltalter* (The Ages of the World), on which Schelling worked during the 1810s and 1820s, interprets the intelligible world, including ourselves, as the result of an ongoing conflict between expansive and contractive forces. He becomes convinced that philosophy cannot finally give a reason for the existence of the manifest world that is the product of this conflict. This leads to his opposition, beginning in the 1820s, to Hegel's philosophical system, and to an increasing concern with theology. Hegel's system claims to be without presuppositions, and thus to be self-grounding. While Schelling accepts that the relations of dependence between differing aspects of knowledge can be articulated in a dynamic system, he thinks that this only provides a 'negative' philosophy, in which the fact of being is to be enclosed within thought. What he terms 'positive' philosophy tries to come to terms with the facticity of 'being which is absolutely independent of all thinking' (2 (3): 164). Schelling endeavours in his *Philosophie der Mythologie* (Philosophy of Mythology) and *Philosophie der Offenbarung* (Philosophy of Revelation) of the 1830s and 1840s to establish a complete philosophical system by beginning with 'that which just exists . . . in order to see if I can get from it to the divinity' (2 (3): 158), which leads to a historical account of mythology and Judeo-Christian revelation. This system does not, however, overcome the problem of the 'alterity' of being, its irreducibility to a philosophical system, which his critique of Hegel reveals. The direct and indirect influence of this critique on Kierkegaard, Nietzsche, Heidegger, Rosenzweig, Levinas, Derrida and others is evident, and Schelling must be considered as the key transitional figure between Hegel and approaches to 'post-metaphysical' thinking.

ANDREW BOWIE

SCHILLER, JOHANN CHRISTOPH FRIEDRICH (1759–1805)

Schiller was an artist first – a major poet and the leading dramatist of eighteenth-century Germany – and an aesthetician second. At the height of his involvement in aesthetics, he calls the philosopher 'a caricature' beside 'the poet, the only true human being'. But reflection had deep roots in his nature, to the point where he felt it inhibited his creativity, yet would also have to be the means to restore it. He eventually came to terms with this paradox by devising a typology of 'naïve' and 'reflective' artists that explained his problem – and incidentally the evolution of modern European literature (*On Naïve and Reflective Poetry*) (1796). Schiller was also driven by a passionate belief in the humanizing and social function of art. His early speech *The Effect of Theatre on the People* (1784; later title *The Stage considered as a Moral Institution*) celebrated the one meeting-place where our full humanity could be restored. In the mature essays of the 1790s, an immensely more complex argument cannot hide the ultimate simplicity of his faith in art, even and especially in the midst of historical crisis: his culminating statement on beauty, *On the Aesthetic Education of Man* (1795), is at the same time a considered response to events in France, where a 'rational' Revolution had turned into a Reign of Terror. Schiller proposes an education for humane balance as the only sufficiently radical answer to the violent excesses of impulse, and argues that art is its only possible agent. Schiller's ideas are imaginative, generous and intuitively appealing as an account of what art is and might do. With the authority of his poetic standing and the high eloquence of his prose, they are powerful cultural criticism. Arguably

they could have been more effective still and less vulnerable if he had not tried to make them something else by giving them a systematic quasi-Kantian form, as a result of which philosophical commentators have often patronized him while the Common Reader has been scared off.

T.J. REED

SCHLEGEL, FRIEDRICH VON (1772–1829)

Schlegel was the major aesthetician of the Romantic movement in Germany during its first formative period (1797–1802). In these years he developed his influential concepts of Romantic poetry and irony, created an original approach to literary criticism and edited the journal of the early Romantic circle, *Athenäum*. Along with F. von Hardenberg (Novalis), F.W.J. Schelling and F.D.E. Schleiermacher, he was also a guiding spirit in the development of a Romantic metaphysics, ethics and politics. His metaphysics attempted to synthesize Fichte's idealism and Spinoza's naturalism. His ethics preached radical individualism and love against the abstract formalism of Kant's ethics. In his early politics Schlegel was very radical, defending the right of revolution and democracy against Kant. In his later years, however, he became much more conservative. His final works are a defence of his neo-Catholic mysticism.

FREDERICK BEISER

SCHLEIERMACHER, FRIEDRICH DANIEL ERNST (1768–1834)

Friedrich Daniel Ernst Schleiermacher was the most notable German-speaking protestant theologian of the nineteenth century. He gave significant impetus to the re-orientation of theology after the Age of Enlightenment (see his speeches *Über die Religion* (*On Religion*) (1799), and also *Kurze Darstellung des theologischen Studiums* (*Brief Outline of Theology as a Field of Study*) (1811)) and he enjoyed a wide audience in Berlin both as preacher and professor of theology and philosophy. Throughout his life he was a fervent advocate of the union between the Lutheran and the Reformed Church established in the so-called Old Prussian Union, and his compendium *Der christliche Glaube* (*The Christian Faith*) (1821, 1822) is held to be the first dogmatics transcending the denominational boundaries between the Reformation Churches. His translation of Plato attained the status of a classic. In his university lectures and academic speeches on philosophy he made a profound and lasting impression on his audience, both in his historical and systematic thought. He also had an important hand in the reform of the German universities. In theology and philosophy he strove to find an independent and intermediate position between the Enlightenment, German idealism and Romanticism.

by J.G. FINLAYSON

SCHLICK, FRIEDRICH ALBERT MORITZ (1882–1936)

Moritz Schlick is usually remembered as the leader of the Vienna Circle, a group that flourished from the late 1920s to the mid-1930s, and made an important contribution to the philosophical movement known as 'logical empiricism'. Yet many of Schlick's most original contributions to philosophy antedated the hey-day of the Circle, providing the foundations for much of its subsequent development. He started his academic career as a physicist, and his early contributions to philosophy include an influential conventionalist interpretation of general relativity and a new account of the definitions of the basic terms of theoretical science. In the debates that flourished within the Vienna Circle he is famous for his commitment to the Principle of Verifiability and his defence of a correspondence theory of truth. In addition, his works during the final years of the Vienna Circle represent some of the most sober reflections on the problems that vexed the early logical empiricists. Although few of the views identified with logical empiricism currently find favour among philosophers, their approach to philosophy, especially their identification of its central perplexities, still wields enormous influence among contemporary thinkers. Since Schlick contributed significantly to the form logical empiricism assumed during its period of dominance, there can be little doubt that his thought continues to inspire much philosophical thinking today.

THOMAS OBERDAN

SCHOPENHAUER, ARTHUR (1788–1860)

Schopenhauer, one of the great prose-writers among German philosophers, worked outside the mainstream of academic philosophy. He wrote chiefly in the first half of the nineteenth century, publishing *Die Welt als Wille und Vorstellung* (*The World as Will and Representation*), Volume 1 in 1818 and Volume 2 in 1844, but his ideas became widely

known only in the half-century from 1850 onwards. The impact of Schopenhauer's philosophy may be seen in the work of many artists of this period, most prominently Wagner, and in some of the themes of psychoanalysis. The philosopher most influenced by him was Nietzsche, who originally accepted but later opposed many of his ideas.

Schopenhauer considered himself a follower of Kant, and this influence shows in Schopenhauer's defence of idealism and in many of his central concepts. However, he also departs radically from Kant. His dominant idea is that of the will: he claims that the whole world is will, a striving and mostly unconscious force with a multiplicity of manifestations. Schopenhauer advances this as a metaphysical account of the world as it is in itself, but believes it is also supported by empirical evidence. Humans, as part of the world, are fundamentally willing beings, their behaviour shaped by an unchosen will to life which manifests itself in all organisms. His account of the interplay between the will and the intellect has been seen as a prototype for later theories of the unconscious.

Schopenhauer is a pessimist: he believes that our nature as willing beings inevitably leads to suffering, and that a life containing suffering is worse than nonexistence. These doctrines, conveyed in a literary style which is often profound and moving, are among his most influential. Equally important are his views on 'salvation' from the human predicament, which he finds in the denial of the will, or the will's turning against itself. Although his philosophy is atheist, Schopenhauer looks to several of the world religions for examples of asceticism and self-renunciation. His thought was partially influenced by Hinduism at an early stage, and he later found Buddhism sympathetic.

Aesthetic experience assumes great importance in Schopenhauer's work. He suggests that it is a kind of will-less perception in which one suspends one's attachments to objects in the world, attaining release from the torment of willing (desire and suffering), and understanding the nature of things more objectively. The artistic genius is the person abnormally gifted with the capacity for objective, will-free perception, who enables similar experiences in others. Here Schopenhauer adopts the Platonic notion of Ideas, which he conceives as eternally existing aspects of reality: the genius discerns these Ideas, and aesthetic experience in general may bring us to comprehend them. Music is given a special treatment: it directly manifests the nature of the will that underlies the whole world.

In ethics Schopenhauer makes thorough criticisms of Kant's theory. He bases his own ethical views on the notion of compassion or sympathy, which he considers a relatively rare quality, since human beings, as organic, willing beings, are egoistic by nature. Nevertheless, compassion, whose worldview minimizes the distinctness of what are considered separate individuals, is the only true moral impulse for Schopenhauer.

SCIENCE, PHILOSOPHY OF

Introduction and historical background

Science grew out of philosophy; and, even after recognizable, if flexible, interdisciplinary boundaries developed, the most fruitful philosophical investigations have often been made in close connection with science and scientific advance. The major modern innovators – Bacon, Descartes, Leibniz and Locke among them – were all centrally influenced by, and in some cases significantly contributed to, the science of their day. Kant's fundamental epistemological problem was generated by the success of science: we have obtained certain knowledge, both in mathematics and – principally due to Newton – in science, how was this possible? Unsurprisingly, many thinkers who are principally regarded as great scientists, had exciting and insightful views on the aims of science and the methods of obtaining scientific knowledge. One can only wonder why the epistemological views of Galileo and of Newton, for example, are not taught along with those of Bacon and Locke, say, in courses on the history of modern philosophy. Certainly it can be argued very convincingly that the former two had at least as much insight into the aims and methods of science, and into how scientific knowledge is gained and accredited, as the latter two (see Galilei, G.; Newton, I.; also see Boyle, R.; Copernicus, N.; Kepler, J.).

In the nineteenth century, Maxwell, Hertz and Helmholz all had interesting views about explanation and the foundations of science, while Poincaré, who was undoubtedly one of the greatest mathematicians and mathematical physicists, was arguably also one of the greatest philosophers of science – developing important and influential views about, amongst other things, the nature of theories and hypotheses, explanation, and the role of probability

theory both within science and as an account of scientific reasoning (also see DUHEM, P.M.M.).

The period from the 1920s to the 1950s is sometimes seen as involving a movement towards more formal issues to the exclusion of detailed concern with the scientific process itself (see LOGICAL POSITIVISM). While this has been over-exaggerated – CARNAP, Hempel, POPPER and especially REICHENBACH for example all show sophisticated awareness of a range of issues from contemporary science (also see OPERATIONALISM) – there is no doubt that general attention in philosophy of science has been redirected back to the details of science, and in particular of its *historical* development, by 'post-positivist' philosophers such as Hanson, FEYERABEND, KUHN, LAKATOS and others.

Current philosophy of science has developed this great tradition, addressing many of the now standard philosophical issues – about knowledge, the nature of reality, determinism and indeterminism and so on – but by paying very close attention to science both as an exemplar of knowledge and as a source of (likely) information about the world. This means that there is inevitably much overlap with other areas of philosophy – notably epistemology (the theory of scientific knowledge is of course a central concern of philosophy of science) and metaphysics (which philosophers of science often shun as an attempted a priori discipline but welcome when it is approached as an investigation of what current scientific theories and practices seem to be telling us about the likely structure of the universe). Indeed one way of usefully dividing up the subject would see scientific epistemology and what might be called scientific metaphysics as two of the main branches of the subject (these two together in turn forming what might be called general philosophy of science), with the third branch consisting of more detailed, specific investigations into foundational issues concerned with particular scientific fields or particular scientific theories (especial, though by no means exclusive, attention having been paid of late to foundational and interpretative issues in quantum theory and the Darwinian theory of evolution). Again not surprisingly, important contributions have been made in this third sub-field by scientists themselves who have reflected carefully and challengingly on their own work and its foundations (see BOHR, N.; DARWIN, C.R.; EINSTEIN, A.), as well as by those who are more usually considered philosophers.

1 Contemporary philosophy of science: the theory of scientific knowledge

Scientists propose theories and assess those theories in the light of observational and experimental evidence; what distinguishes science is the careful and systematic way in which its claims are based on evidence (see SCIENTIFIC METHOD). These simple claims, which I suppose would win fairly universal agreement, hide any number of complex issues.

First, concerning theories: how exactly are these best represented? Is Newton's theory of gravitation, or the neo-Darwinian theory of evolution, or the general theory of relativity, best represented – as logical empiricists such as Carnap supposed – as sets of (at least potentially) formally axiomatized sentences, linked to their observational bases by some sort of correspondence rules? Or are they best represented, as various recent 'semantic theorists' have argued, as sets of models (see MODELS; THEORIES, SCIENTIFIC)? Is this simply a representational matter or does the difference between the two sorts of approach matter scientifically and philosophically? This issue ties in with the increasingly recognized role of idealizations in science and the role of models as intermediates between fundamental theory and empirical laws (see CAMPBELL, N.R.; IDEALIZATIONS). It also relates to an important issue about how best to think of the state of a scientific field at a given time: is a scientist best thought of as accepting (in some sense or other) a single theory or set of such theories or rather as accepting some sort of more general and hierarchically organized set of assumptions and techniques in the manner of Kuhnian paradigms or Lakatosian research programmes? It seems likely that arriving at the correct account of scientific development and in particular of theory-change in science will depend on identifying the 'right' account of theories.

Next concerning the *evidence*: it has long been recognized that many of the statements that scientists are happy to regard as 'observation sentences' in fact presuppose a certain amount of theory, and that *all* observation sentences, short perhaps of purely subjective reports of current introspection, depend on some sort of minimal theory (even 'the needle points to around 5 on the scale' presupposes that the needle and the scale exist independently of the observer and that the observer's perception of them is not systematically deluded by a Cartesian demon). Does this mean that there is no real epistemic distinction between observational and theoretical claims? Does it mean that there is no secure basis or foundation for science in the form of observational and experimental results (see OBSERVATION)? If so, what becomes of the whole empiricist idea of basing

scientific theories on the evidence? It can be argued that those who have drawn dire consequences from these considerations have confused fallibility with (serious) corrigibility: that there are observation statements, such as reports of meter readings and the like, of a sufficiently low level as to be, once independently and intersubjectively verified, not seriously corrigible despite being trivially strictly fallible (see MEASUREMENT, THEORY OF). Aside from this issue, experiment was for a long time regarded as raising barely any independent, philosophical or methodological concern – experiments being thought of as very largely simply means for testing theories (see EXPERIMENT). More recently, there has been better appreciation of the extent to which experimental science has a life of its own, independent of fundamental theory, and of the extent to which philosophical issues concerning testing, realism, underdetermination and so on can be illuminated by studying experiments.

Suppose that we have characterized scientific theories and drawn a line between theoretical and observational statements, what exactly is involved in 'basing' theoretical claims 'systematically and carefully' on the evidence? This question has of course been perhaps *the* central question of general philosophy of science in this century. We have known at least since David HUME that the answer cannot be that the correct theories are *deducible* from observation results. Indeed not only do our theories universally generalize the (inevitably finite) data as Hume pointed out, they also generally 'transcend' the data by explaining that data in terms of underlying, but non-observable, theoretical entities. This means that there must always in principle be (indefinitely) many theories that clash with one another at the theoretical level but yet entail all the same observational results (see UNDERDETERMINATION). What extra factors then are involved over and beyond simply having the right observational consequences? What roles do such factors as simplicity (see SIMPLICITY (IN SCIENTIFIC THEORIES)) and explanatory power (see EXPLANATION), play in accrediting theories on the basis of evidence? Moreover what status do these factors have – are they purely pragmatic (the sorts of features *we* like theories to have) or are they truth-indicating, and if so why? Some have argued that the whole process can be codified in probabilistic terms – the theories that we see as accredited by the evidence being the ones that are at any rate *more probable* in the light of that evidence than any of their rivals (see CONFIRMATION THEORY; INDUCTIVE INFERENCE).

Finally, suppose we have characterized the correct scientific way of reasoning to theories from evidence, what exactly does this tell us about the theories that have been thus 'accredited' by the evidence? And what does it tell us about the entities – such as electrons, quarks, and the rest – apparently postulated by such theories? Is it reasonable to believe that these accredited theories are *true* descriptions of an underlying reality, that their theoretical terms refer to real, though unobservable, entities? (Or at least to believe that they are *probably* true? or *approximately* true? Or perhaps probably approximately true?) More strongly still, is any one of these beliefs the *uniquely* rational one? Or is it instead more, or at least equally, reasonable – at least equally explanatory of the way that science operates – to hold that these 'accredited' theories are no more than empirically adequate, even that they are simply instruments for prediction, the theoretical 'entities' they involve being no more than convenient fictions (see CONVENTIONALISM; INCOMMENSURABILITY; PUTNAM, H.; SCIENTIFIC REALISM AND ANTIREALISM)? One major problem faced by realists is to develop a plausible response to once accepted theories that are now rejected either by arguing that they were in some sense immature – not 'fully scientific' – or that, despite having been rejected, they nonetheless somehow live on as 'limiting cases' of current theories (see ALCHEMY; VITALISM).

Clearly an antirealist view of theories would be indicated *if* it could convincingly be argued that the accreditation of theories in science is not simply a function of evidential and other truth-related factors or even of epistemic pragmatic factors, but *also* of broader cultural and social matters. Although such arguments are heard increasingly often, many remain unconvinced – seeing those arguments as based *either* on confusion of discovery with validational issues *or* on fairly naïve views of evidential support (see CONSTRUCTIVISM; DISCOVERY, LOGIC OF).

2 Contemporary philosophy of science: 'scientific metaphysics'

Suppose that we take a vaguely realist view of current science; what does it tell us about the general structure of reality? Does a sensible interpretation of science require the postulation, for example, of natural kinds (see NATURAL KINDS) or universals? Does it require the postulation of a notion of physical necessity to distinguish natural laws from 'mere' regularities (see LAWS, NATURAL)? What is the nature of probability (see PROBABILITY, INTERPRETATIONS OF) – is a probabilistic claim invariably an expression of (partial) ignorance or are there real, irreducible 'objective chances' in the world? What exactly is involved in the claim that a particular theory (or a particular system described

by such a theory) is deterministic (see DETERMINISM AND INDETERMINISM), and what would it mean for the world as a whole to be deterministic? Does even 'deterministic' science eschew the notion of *cause* (as Russell argued)? Does this notion come into its own in more 'mundane' contexts, involving what might be called 'causal factors' and probabilistic causation? What exactly is the relationship between causal claims – such as 'smoking causes heart disease' – and statistical data (see CAUSATION)? How should spacetime be interpreted (see SPACETIME): as substantive or as 'merely' relational? Does current science plus whatever ideas of causality are associated with it unambiguously rule out the possibility of time travel (see TIME TRAVEL), or does this remain at least logically possible given current science?

Finally, and most generally, what is science (or, perhaps more significantly, the *direction* of scientific development) telling us about the overall structure of the universe – that it is one simple system governed at the fundamental level by one unified set of general laws, or rather that it is a 'patchwork' of interconnected but separate, mutually irreducible principles (see UNITY OF SCIENCE; REDUCTION, PROBLEMS OF)? Although it is of course true – despite some exaggerated claims on behalf of 'theories of everything' – that science is very far from reducing everything to a common fundamental basis, and although it is of course true that, even in cases where reduction is generally agreed to have been achieved, such as that of chemistry to physics, the reduction is *ontological* (that is, chemistry has been shown to need no essential, non-physical primitive notions) rather than *epistemological* (no one would dream of trying actually to *derive* a full description of any chemical reaction from the principles of quantum mechanics), some would nonetheless still argue that the overall *tendency* of science is in the reductionist direction.

These are examples of the more or less general, and impressively varied, 'metaphysical' issues informed by science that have attracted recent philosophical attention.

3 Contemporary philosophy of science: foundational issues from current science

Many of the most interesting issues in current philosophy of science are closely tied to foundational or methodological concerns about current scientific theory. One fertile source of such concerns is quantum theory. How much of a revolutionary change in our general metaphysical view of the world does it require? Is the theory irreducibly indeterministic or do 'hidden variable' interpretations of some sort remain possible despite the negative results? What does quantum mechanics tell us about the notion of cause? Does quantum mechanics imply a drastic breakdown of 'locality', telling us that the properties of even vastly spatially separated systems are fundamentally interconnected – so that we can no longer think of, for example 'two' spatially separated electrons as separate, independent 'particles'? More directly, is there, in view of the 'measurement problem' a coherent interpretation of quantum mechanics at all? (It has been argued that when the theory is interpreted universally so that *all* systems, including 'macroscopic' ones, such as measuring apparatuses, are assigned a quantum state then the two fundamental principles of quantum theory – the Schrödinger equation and the projection postulate – come into direct contradiction (see BELL'S THEOREM; QUANTUM MEASUREMENT PROBLEM; QUANTUM MECHANICS, INTERPRETATION OF; see also RANDOMNESS; STATISTICS).)

Although perhaps attracting relatively less attention than quantum theory, the other two great theories that form the triumvirate at the heart of contemporary physics – relativity (both special and general) and thermodynamics – pose similarly fascinating problems. In the case of relativity theory, philosophers have raised both ontological issues (for example, concerning the nature of spacetime) and epistemological issues (concerning for example the real role played in Einstein's development of the theory by Machian empiricism, the role of allegedly crucial experiments such as that of Michelson and Morley (see CRUCIAL EXPERIMENTS), and the evidential impact on the general theory of the Eddington star-shift experiment). There are also important issues about the consistency of relativity and quantum theory – issues that in turn feed into the more general questions concerning the unity of science and realism (see RELATIVITY THEORY, PHILOSOPHICAL SIGNIFICANCE OF).

Thermodynamics raises issues about, amongst other things, probability and the testing of probabilistic theories, about determinism and indeterminism, and about the direction of time (see THERMODYNAMICS; DETERMINISM AND INDETERMINISM; DUHEM, P.M.M.; TIME). Other current areas of physics, too, raise significant foundational issues (see CHAOS THEORY; COSMOLOGY).

For a long time, philosophy of science meant in effect philosophy of *physics*. A welcome broadening-out has occurred recently – especially in the direction of philosophy of biology. The central concern here has been with foundational issues in the Darwinian theory of evolution (or more accurately the neo-Darwinian synthesis of natural selection and genetics). Questions have been raised about the testability and, more generally, the empirical credentials of that theory, about the scope of the

theory (in particular what it can tell us about humans and human societies), about the appropriate 'unit of selection' (individual, gene, group), about what exactly are genes and what exactly are species, and about whether evolutionary biology involves distinctive – perhaps even in *some* sense 'teleological' – modes of explanation (see DARWIN, C.R.; EVOLUTION, THEORY OF; FUNCTIONAL EXPLANATION; GENETICS; LIFE, ORIGIN OF; SOCIOBIOLOGY; SPECIES; TAXONOMY). More recently philosophy of biology has started to widen its own scope by considering issues outside of evolutionary theory, where, however, issues of reductionism and of the possibility of distinctive modes of explanation still loom large.

SCIENTIFIC METHOD

Introduction

Procedures for attaining scientific knowledge are known as scientific methods. These methods include formulating theories and testing them against observation or experiment. Ancient and medieval thinkers called any systematic body of knowledge a 'science', and their methods were aimed at knowledge in general. According to the most common model for scientific knowledge, formulated by Aristotle, induction yields universal propositions from which all knowledge in a field can be deduced. This model was refined by medieval and early modern thinkers, and further developed in the nineteenth century by Whewell and Mill.

As Kuhn observed, idealized accounts of scientific method must be distinguished from descriptions of what scientists actually do. The methods of careful observation and experiment have been in use from antiquity, but became more widespread after the seventeenth century. Developments in instrument making, in mathematics and statistics, in terminology, and in communication technology have altered the methods and the results of science.

1 'Method' and 'science'

'Method' comes from the Greek *meta* (after) plus *hodos* (path or way). A method is a way to achieve an end; a scientific method is a way to achieve the ends of science. What those ends are depends on what science is or is taken to be. The word 'science' now means primarily natural science, examples of which are physics, astronomy, biology, chemistry, geology and psychology, and it applies secondarily to social sciences such as economics and sociology. Discussions of method focus on the cognitive aims of science, which may include knowledge, understanding, explanation, or predictive success, with respect to all or part of nature or to some domain of natural or social phenomena. Abstractly described, scientific method is the means for attaining these aims, especially by forming models, theories, or other cognitive structures and testing them through observation and experiment (see EXPERIMENT; MODELS; OBSERVATION; THEORIES, SCIENTIFIC). Investigations of scientific method may describe the methods actually employed by scientists, or they may formulate proposals about the procedures that should be followed to achieve scientific knowledge.

The main features traditionally ascribed to 'the scientific method' – including clear statement of a problem, careful confrontation of theory with fact, open-mindedness, and (potential) public availability or replicability of evidence – are common to many cognitive endeavours, including much work in the

humanities. Although there is no single method that distinguishes science from other intellectual practices, the following features are characteristic of the natural and social sciences: the use of quantitative data and of theories formulated mathematically; the use of artificially created experimental situations; and an interest in universal generalizations or laws (see DEMARCATION PROBLEM; LAWS, NATURAL; UNITY OF SCIENCE). (But note that biological taxonomies are not intrinsically quantitative, and that neither astronomy nor economics is based primarily on experiment.) In both the natural and social sciences, the formation of models or theories may involve skills in mathematical computation and derivation, in evaluating consistency, in imagining new theoretical possibilities, in assessing the structure of a taxonomy, or in relating one area of investigation to other areas. The means for testing theories or generating new empirical knowledge vary widely, and include systematic observation, unsystematic observation, checks against background theories or knowledge, and various experimental procedures, including sophisticated statistical techniques, the construction of special instruments or apparatus and the use of specially bred laboratory animals.

2 Ideas of method from the Greeks to Thomas Kuhn

Because 'science' originally meant any systematic body of knowledge, ranging from mathematics to theology, the method of science was the method for obtaining, or perhaps merely for presenting and teaching, knowledge in general. Methods varied in relation to beliefs about what there is to be known.

The writings of Plato and Aristotle embody contrasting conceptions of both the objects of knowledge and the method for knowing them. In *Republic* VI, Plato divided the objects of knowledge into two realms: the visible and the intelligible (see PLATO §14). He considered the former to include the objects of the senses, about which only opinion but not genuine knowledge is possible, and the latter to include geometry and astronomy, in which investigators assume the existence of their objects (such as geometrical objects) and reason from them as from hypotheses. In the highest reaches of the intelligible realm, reason attempts to reach 'the first principle of all that exists', from which it then 'comes down to a conclusion . . . proceeding by means of Forms and through Forms to its conclusions which are Forms', without any reference to the visible world. Plato conceived the sensible world as a dim reflection of the intelligible Forms, and he held that the Forms themselves are best known through direct intellectual contemplation, independent of sensory experience. The notion of an intelligible world behind the sensible world, and especially of a world described by mathematics, has played an important role in physical science since Plato's time.

ARISTOTLE rejected Plato's intelligible realm because it removed the objects of mathematical sciences such as astronomy from the sensible world, where he believed the forms of things are to be found. He carried out extensive observations (including dissections) in biology and developed a preliminary taxonomic scheme. Aristotle's principal discussion of method is the *Posterior Analytics*, a founding work in the philosophy of science. He accepted the Platonic distinction between a direction of cognition that is going 'to the forms' and the direction of cognition (as in syllogistic demonstration) that proceeds 'from the forms', but he conceived these processes as starting from sensible objects and arriving at knowledge of the common natures or essences of things as existing in those objects. Such knowledge (for instance, of the essence of a specific kind of mineral, or kind of living thing) yields a set of core propositions in each science, from which other knowledge is to be deductively derived.

Medieval philosophers, including Roger BACON, John DUNS SCOTUS and WILLIAM OF OCKHAM, commented extensively on Aristotle's methodological writings, which were later discussed at the University of Padua together with those of Galen. A central topic was the distinction between analysis and synthesis, or, as it was sometimes called, between resolution and composition. In the analytic phase of inquiry, one resolves the object of investigation into its basic constituents or least elements so as to determine its first principles. In the synthetic phase, one explains a subject matter from its first principles, or presents a body of knowledge by deriving it from such principles. In a common example, the analytic phase would include the search for the axioms, postulates and definitions of geometry; the synthetic phase the demonstration of theorems from those axioms and postulates. Bacon suggested that the first principles achieved in the analytic or inductive phase can be tested by deducing and checking new consequences (a feature of 'hypothetico-deductive' tests of theories). Scotus outlined a method of agreement, in which a possible cause for an effect is found by listing the circumstances that co-occur with the effect and looking for one that is present every time. Ockham suggested a method of difference, in which a circumstance that is present when the effect is present and absent when it is absent is considered as a possible cause for the effect.

The seventeenth century, a time of fundamental change in physics and astronomy, saw continuing

attention to method within the inductive-deductive framework established by Aristotle. Francis Bacon outlined inductive procedures in detail, calling for extensive collections of data (named 'histories') which are to be culled systematically for general principles or laws. Galileo urged that mathematical descriptions be fitted to natural phenomena through observation and experiment (see Galilei, G.). Descartes wrote in *Discourse on the Method* (1637) that the derivation of an effect from a cause may serve as an explanation of the effect, and also as an empirical 'proof' of the posited cause (see Descartes, R. §6). Newton, in *Mathematical Principles of Natural Philosophy* (1729), laid down several 'hypotheses' or 'rules' for reasoning in natural philosophy. He advised investigators to avoid multiplying causes in relation to effects, to generalize from properties found in bodies that have been observed to all bodies in the universe, and to accept inductively supported propositions as 'accurately or very nearly true' until new observations improve upon their accuracy or limit their scope (see Newton, I.).

During the nineteenth century, the 'philosophy of science' or the 'logic of science' became, in the writings of William Whewell, John Stuart Mill and others, a main staple of philosophy. Whewell's *Philosophy of the Inductive Sciences* (1840) analyses scientific knowledge of 'external' nature (excluding the mind itself). Whewell held that scientific knowledge is based upon sensations and ideas, the former being the 'objective' element (caused by objects), the latter a 'subjective' element (provided by the knowing subject). Consciously entertained facts and theories correspond to sensations and ideas, but not completely, because all facts implicitly include ideas (and so, possibly, theory). Whewell divided the methods of science into methods of observation, of obtaining clear ideas, and of induction. The methods of observation include quantitative observation (as in chemistry or astronomy) and the perception of similarities (as in natural history); observation includes both the collection and classification of facts. Clear ideas result from intellectual education (including both the mathematical sciences and natural history), and from discussion, including (sometimes metaphysical) discussions of definitions, such as whether uniform force acting in free fall should be defined relative to space or to time. Science proceeds by 'induction', including the use of quantitative techniques to smooth out the irregularities of observation (that is, the 'method of curves' by which a curve is fitted to data points, the 'method of means' and the 'method of least squares') and the formation and empirical testing of tentative hypotheses. Laws of phenomena are usually formed first, but theories of true causes are desired, such as (Whewell explained) have been found in physical astronomy, physical optics, and geology, and might be found with respect to heat, magnetism, electricity, chemical compounds and living organisms.

In *A System of Logic* (1843), Mill analysed the methods of science even more fully than had Whewell, now including psychology and the social sciences (also known as the 'mental' and 'moral' sciences). In his analysis of experimental method, Mill included the methods of agreement and difference already mentioned, and added the method of residues, which directs the investigator to look for the (as yet unknown) causes of those effects that remain after all other effects have been assigned to known causes, and the method of concomitant variations, according to which those phenomena that vary regularly in quantitative degree with one another are assumed to be causally related. Like Whewell, Mill emphasized the role of new or pre-existing concepts and names in scientific observation, and the role that classification plays in induction. He proposed that psychology and the social sciences should adopt the explanatory structures of the natural sciences, a proposal frequently criticized since his time, notably by the Neo-Kantians Wilhelm Dilthey, Heinrich Rickert and Ernst Cassirer, who discussed methods pertaining to the 'social' or 'human' sciences, and who included the humanities as a form of 'science' (in German, *Wissenschaft*) (see Neo-Kantianism; Positivism in the social sciences).

Philosophers in the first half of the twentieth century, especially the Vienna Circle and Karl Popper, sought to analyse science and to reconstruct scientific reasoning using the new symbolic logic or the new theory of probability (see Vienna Circle). They continued the investigation of theory confirmation, focusing on recent theories in physics (see Confirmation theory). Rudolph Carnap attempted unsuccessfully to develop a quantitative theory of inductive support. Carl Hempel, who favoured a hypothetico-deductive account of scientific confirmation (involving the testing of theories by their deductive consequences), revealed certain paradoxes that result when the relation between scientific generalizations and confirming instances are expressed in predicate logic and certain (plausible) assumptions are made. Popper concluded that the defining feature of the empirical methods of science is that statements are always subjected to falsification by new data.

In the second half of the twentieth century philosophical analyses of scientific method broadened to again include sciences such as biology and geology, and paid greater attention to the history of science. N.R. Hanson recalled the often implicit

role of theory in observation, questioning the notion of a theory-neutral observation language (see OBSERVATION). Thomas S. KUHN emphasized the social nature of scientific communities and the common training that produces a shared vocabulary and set of experimental procedures. Kuhn and Paul FEYERABEND stressed the need to distinguish the idealized accounts of scientific method given by some scientists and philosophers from the actual methodological practices of scientists. In studying the latter, historical and sociological investigation supplements the participatory acquaintance with scientific research possessed by scientists themselves and by some philosophers.

3 *Scientific method in scientific practice*

The methods of careful observation and description (including quantitative description) and of controlled experiment arose in antiquity and were practised by Greek, Hellenistic and Islamic investigators. Examples include Aristotle's biological observations, the many Greek and Arabic (and earlier Babylonian) tables of astronomical data, Ptolemy and Alhazen's careful studies of binocular vision and distance perception, and Galen's use of the ligature and other experimental techniques in physiology.

From antiquity, instruments aided the precision of observation in astronomy and optics. In the early seventeenth century Johannes KEPLER used Tycho Brahe's precise astronomical data (obtained with improved instruments) to establish the elliptical orbits of the planets and to determine the relations among the sizes and periods of those orbits. In 1609 Galileo used the newly invented telescope to observe previously unseen heavenly bodies (including the moons of Jupiter). Later in the century the microscope opened new fields of observation. The nineteenth and twentieth centuries have seen the development of refined and often complex instrumentation in all branches of natural science, including biology, chemistry and psychology, ranging from improved balances to the electron microsope and the space telescope. Photography has been used to record data in nearly every field. The computer permits collection and manipulation of larger bodies of data than was previously practical. In psychology, the computer allows generation of precisely controlled stimuli and the recording of data with highly accurate temporal measurement.

The development of mathematics, including probability and statistics, has yielded new forms of theory statement and new descriptions of observational or experimental data. Mathematical sciences from antiquity to the seventeenth century used geometry almost exclusively. The development of algebraic geometry and of the calculus permitted new statements of Newtonian mechanics in the eighteenth century, and opened up new possibilities (theoretical as well as experimental) for describing and investigating functional relations among quantities. In the nineteenth and twentieth centuries, new mathematics has been demanded by or has facilitated mathematical physics. Thus, the discovery of non-Euclidean geometries opened up hitherto unforeseen theoretical possibilities in physical cosmology. The development of probability and statistics permitted the formulation of statistical laws, as in mathematical genetics, quantum physics and sociology (see PROBABILITY, INTERPRETATIONS OF; STATISTICS; STATISTICS AND SOCIAL SCIENCE). Inferential statistics is widely used in the analysis of quantitative data in psychology and other sciences.

Clear and precise terminology is an important feature of scientific methodology. Astronomy, optics (as the science of vision), natural history and medicine developed technical vocabularies in antiquity. Newton profoundly altered the terminology of physics, which continues to change as theories change. Carl von Linnaeus invented important taxonomies in botany and zoology; after Darwin's theory of natural selection gained acceptance, evolutionary history influenced biological taxonomy (see EVOLUTION, THEORY OF; TAXONOMY). Molecular biology has produced another new terminology. In psychology, long-standing mentalistic terminology was purged by twentieth-century behaviourists (see BEHAVIOURISM, METHODOLOGICAL AND SCIENTIFIC), and has since been reintroduced, partly under the influence of the computer metaphor for mental processes (see MIND, COMPUTATIONAL THEORIES OF). Likewise, economics, anthropology and sociology use refined technical vocabularies.

A sense of the various instruments and techniques of data collection and analysis now used can be gleaned from the materials, methods and results sections of scientific journals. Journals and other means of communication are themselves of methodological significance. The available methods for presenting observational data were radically altered by the development of printing (for both text and images), and again through computer-generated images and electronic communication. The mass production of standardized illustrations and printed data permits worldwide dissemination, utilization and hence testing of scientific findings.

The structure of scientific research groups and their interaction with scientific institutions, including the processes for deciding whether to fund research or to publish results, are also part of the method of science (broadly conceived). The

methodological effectiveness of science can be evaluated at various scales, including the individual experiment, the individual investigator, the laboratory group, or the institutional structures by which collective instruments such as particle accelerators are administered. One might further examine the normative consequences of having relative homogeneity of methodological and theoretical belief across an active science, as opposed to the hedged bet of methodological and theoretical diversity. The student of scientific methods may investigate any aspect of the linguistic, conceptual, psychological, instrumental, social and institutional features of the sciences that affects their cognitive products.

SCIENTIFIC REALISM AND ANTIREALISM

Introduction

Traditionally, scientific realism asserts that the objects of scientific knowledge exist independently of the minds or acts of scientists and that scientific theories are true of that objective (mind-independent) world. The reference to knowledge points to the dual character of scientific realism. On the one hand it is a metaphysical (specifically, an ontological) doctrine, claiming the independent existence of certain entities. On the other hand it is an epistemological doctrine asserting that we can know what individuals exist and that we can find out the truth of the theories or laws that govern them.

Opposed to scientific realism (hereafter just 'realism') are a variety of antirealisms, including phenomenalism and empiricism. Recently two others, instrumentalism and constructivism, have posed special challenges to realism. Instrumentalism regards the objects of knowledge pragmatically, as tools for various human purposes, and so takes reliability (or empirical adequacy) rather than truth as scientifically central. A version of this, fictionalism, contests the existence of many of the objects favoured by the realist and regards them as merely expedient means to useful ends. Constructivism maintains that scientific knowledge is socially constituted, that 'facts' are made by us. Thus it challenges the objectivity of knowledge, as the realist understands objectivity, and the independent existence that realism is after. Conventionalism, holding that the truths of science ultimately rest on man-made conventions, is allied to constructivism.

Realism and antirealism propose competing interpretations of science as a whole. They even differ over what requires explanation, with realism demanding that more be explained and antirealism less.

1 Arguing for realism

Late nineteenth- and early twentieth-century debates over the reality of molecules and atoms polarized the scientific community on the realism question. Antirealists like Mach, Duhem and Poincaré – representing (roughly) phenomenalist, instrumentalist and conventionalist positions – at first carried the day with a sceptical attitude towards the truth of scientific theories and the reality of the 'theoretical entities' employed by those theories (see Phenomenalism; Conventionalism). Led by the successes of statistical mechanics (see Thermodynamics) and relativity (see Relativity theory, philosophical significance of), however, Planck and Einstein helped turn the tide towards realism. That movement was checked by two developments. In physics the quantum theory of 1925–6 quickly ran into difficulties over the possibility of a realist interpretation (see Quantum mechanics, interpretation of) and the community settled on the instrumentalist programme promoted by Bohr and Heisenberg. This was a formative lesson for logical empiricism whose respect for developments in physics and whose positivistic orientation led it to brand the realism question as metaphysical, a pseudo-question. Thus

for a while empiricist and instrumentalist trends in science and philosophy eclipsed scientific realism.

The situation changed again in the 1960s, by which time science and its technological applications had become a ubiquitous and dominant feature of Western culture. In this setting philosophers like Smart and PUTNAM proposed what came to be known as the 'miracles' argument for scientific realism. They argued that unless the theoretical entities employed by scientific theories actually existed and the theories themselves were at least approximately true of the world at large, the evident success of science (in terms of its applications and predictions) would surely be a miracle. It is easy to see, at least with hindsight, that the most one could conclude from scientific success, however impressive, is that science is on the right track. That could mean, as the argument concludes, on the track to truth or it could just mean on the track to empirical success, perhaps with deeply flawed representations of reality. The 'miracles' argument is inconclusive. Nevertheless, during the next two decades it was compelling for many philosophers. Indeed, during this period realism became so identified with science that questioning realism was quickly put down as anti-science.

Realist orthodoxy found support in Popper's attack on instrumentalism, which he criticized as unable to account for his own falsificationist methodology (see POPPER, K.R.). Broadening this line, Boyd developed an explanationist version of the 'miracles' argument that focused on the methods of science and tried as well to give proper due to the human-centred (constructivist and conventionalist) aspects of science emphasized by KUHN and FEYERABEND. Boyd asks why methods crafted by us and reflecting our interests and limitations lead to instrumentally successful science. Contrasting realism with empiricism and constructivism, he finds that realism offers the best (indeed, the only) explanation. That is because, he argues, if we begin with truths or near-truths the methods we have crafted for science produce even more of the same. Since it is only realism that demands the truth of our scientific theories, then realism wins as giving the best explanation for the instrumental success of science. Hence, like a scientific hypothesis, realism is most likely to be true and we should believe in it.

The explanationist argument is carefully framed so that we ask only about the instrumental success of science; that is, success at the observational level. To take science as successful (for example, truth-producing) at the theoretical level would beg the question against empiricism and instrumentalism. Once this is recognized, however, we can see a significant gap in the reasoning. The argument is driven by a picture of science as generating new truths from old truths, but the explanatory issue raised is only about truths at the level of observation, not about truths in general. Antirealists might well reject this as an illegitimate request for explanation. If they accept it, there is an obvious empiricist or instrumentalist response: namely, that our scientific methods are made by us to winnow out instrumentally reliable information. If we begin with fairly reliable statements, the methods we have crafted for science will produce even more. Thus the explanation for scientific success at the instrumental level need not involve the literal truth of our scientific principles or theories, just their instrumental reliability. This move nicely converts the argument for realism as the best explanation of scientific success into an argument for instrumentalism.

There is a second problem with the explanationist tactic, perhaps even more serious. The conclusion in support of realism depends on an inference to the best explanation (see INFERENCE TO THE BEST EXPLANATION). That principle, to regard as true that which explains best, is a principle that antirealisms (especially instrumentalism and empiricism) deny. Van Fraassen, for example, regards being the best explanation as a virtue, but one separate from truth. (He reminds us that the best may well be the best of a bad lot.) Although not required, there could perhaps be an instrumentalist principle of inference to the best explanation. It would not infer to the truth of the explanation but to its instrumental reliability (or empirical adequacy) – precisely the strategy pursued above where we infer instrumentalism from the instrumental success of science. Thus the explanationist argument uses a specifically realist principle of inference to the best explanation and, in so doing, begs the question of truth versus reliability, one of the central questions at issue between realism and antirealism.

2 Piecemeal realisms

Inference to the best explanation promised the most cogent version of the 'miracles' argument. Its inadequacy hastened a retreat from realism's original undertaking as a global interpretation of science. Retreat was fostered by two other antirealist developments. One was the pessimistic meta-induction to the instability of current science, a conclusion based on the repeated overthrow of scientific theories historically and the consequent dramatic alterations in ontology. The other was a sharpening of the underdetermination thesis associated with Poincaré and Duhem, suggesting that there may be empirically equivalent theories between which no evidence can decide (see UNDERDETERMINATION). Both developments

tended to undermine claims for the reality of the objects of scientific investigation and the truth of scientific theories.

Pursuing a salvage operation, several philosophers suggested that realism could confine itself to being a doctrine about the independent existence of theoretical entities ('entity realism') without commitment to the truth of the theories employing them. Hacking proposed an 'experimental argument' for this entity realism; roughly, that if you can deploy entities experimentally to discover new features of nature (for example, use an electron gun to learn about quarks), then the entities must be real whether or not the covering theories are true (see EXPERIMENT). Cartwright suggested that the strategy of inference to the best explanation be confined to an inference to the causes of phenomena, since causes are unquestionably real. To the antirealist, however, these related strategies seem far from compelling. For one thing, it is not clear that one can so neatly disengage theoretical entities from their covering theories. Moreover, in both cases, we can see that the basis on which one is asked to draw a realist conclusion need support no more than a conclusion about utility or reliability. In Hacking's case one need conclude only that electrons are a useful theoretical construct (perhaps a useful fiction?) and in Cartwright's that certain causal hypotheses are reliable in certain domains.

Faced with these difficulties realism has fragmented even further. Sometimes it takes an historicist turn, countering the pessimistic meta-induction by endorsing as real only those fruitful entities that survive scientific revolutions. Sometimes realism becomes highly selective in other ways; for example, looking only at what seems essential in specific cases of explanatory or predictive success, or at entities that stand out as supported by only the very best scientific evidence. Although each of these principles locates matters of scientific significance, it is not clear that such criteria overcome the general strategies that have undone global realist arguments. In particular they do not seem to discriminate effectively between what is real and what is merely useful (and so between realism and instrumentalism).

3 Alternatives to realism

Several alternatives to realism have developed during the course of these debates. Principal among them are Putnam's 'internal realism' (see PUTNAM, H.), van Fraassen's 'constructive empiricism' and what Fine calls 'the natural ontological attitude', or NOA. In a chameleon-like move, Putnam switched from being realism's champion to its critic. Rejecting what he called 'metaphysical realism' (associated with a 'God's eye view'), Putnam proposed a perspectival position in which truth is relative to language (or conceptual scheme). He could then allow scientific claims to be true in their proper domain but deny that they tell the whole story, or even that there is a whole story to tell. His picture was that there could be other truths – different stories about the world – each of which it may be proper to believe. Van Fraassen's constructive empiricism eschews belief in favour of what he calls commitment. He takes the distinguishing features of realism as twofold: realism seeks truth as a goal, and when a realist accepts a theory it is accepted as true. Constructive empiricism, by contrast, takes empirical adequacy (not truth) as the goal of science, and when it accepts a theory it accepts it as empirically adequate. This involves commitment to working within the framework of the theory but not to believing in its literal truth. Unlike these others, Fine's NOA is not a general interpretive scheme but simply an attitude that one can take to science. The attitude is minimal, deflationary and expressly local. It is critically positive, looking carefully at particular scientific claims and procedures, and cautions us not to attach any general interpretive agenda to science. Thus NOA rejects positing goals for science as a whole, as realists and constructive empiricists do. NOA accepts 'truth' as a semantic primitive, but rejects any general theories or interpretations of scientific truth, including the perspectivalism built into internal realism and the external-world correspondence built into realism itself. NOA is perhaps better classified as a nonrealism than as an antirealism.

It is interesting to contrast how these positions respond to good science. Realism accepts good science as true of an observer-independent world; internal realism accepts it as true relative to our scheme of things; constructive empiricism accepts it only as empirically adequate. NOA simply accepts it. This brings out two significant features of the recent debates. One is that they are more about the reach of evidence (what kind of acceptance is warranted) than about the metaphysical character of the objects of belief. The contrast also shows that major contenders, whether realist or not, share a basically positive attitude towards science. This has not always been acknowledged and a contrary suspicion still attaches to constructivism, which is frequently regarded as anti-science.

4 The constructivist challenge

Contemporary developments in the history and sociology of science have revived constructivist approaches (see CONSTRUCTIVISM). Sharing with instrumentalism and other forms of pragmatism an

emphasis on science as an activity, constructivism borrows the Marxist vocabulary of the 'production' of ideas to place science among the manufacturing institutions. Specifically, what science makes is knowledge, which includes concepts and theories, along with things and even facts. Constructivism also emphasizes that science is open-ended. It highlights the role of unforced judgment in scientific practice, challenging the picture of a strict scientific method and of decision-making forced by rationality at every turn. The upshot is to see science as a form of human engagement like others; just people doing their own thing as best they can. Many regard this placement of science as a displacement, demoting science from its privileged position as the paradigm of rational and objective inquiry.

The emphasis on human constructions may challenge the mind-independence that is the hallmark of realist metaphysics. The respective roles of the social order and of nature in shaping these constructions, however, differ among constructivists, making for strong idealism at one pole (see IDEALISM) and pragmatic realism at the other. Despite these differences, constructivism challenges the unique position that realism marks out for itself with respect to ongoing science. If we look beyond the relatively sophisticated arguments for realism rehearsed above, perhaps realism's major hold on our attention is its claim to offer the only viable setting for understanding scientific practice. We are told that unless we take scientists to be engaged in finding out about a world not of their own making we cannot begin to understand how science works. The major constructivist challenge is right here. The heart of constructivism consists in richly detailed studies of science in action. These studies set out to understand how science actually proceeds while bracketing the truth-claims of the area of science under investigation. Instead, constructivists typically employ little more than everyday psychology and an everyday pragmatism with respect to the common objects of experience. To the extent to which these studies succeed they paint a picture of science quite different from realism's, a constructivist picture that may undermine not only the arguments but also the intuitions on which scientific realism rests.

SCIENTIFIC THEORIES

See THEORIES, SCIENTIFIC

SCOPE

Scope is a notion used by logicians and linguists in describing artificial and natural languages. It is best introduced in terms of the languages of formal logic. Consider a particular occurrence of an operator in a sentence – say, that of → in eqn (1), or that of the universal quantifier ∀ in eqn (2).

(1) $A \rightarrow (B \,\&\, C)$

(2) $\forall x(Bxy \rightarrow \exists\, yAxy)$

Speaking intuitively, the scope of the operator is that part of the sentence which it governs. The scope of → in (1) is the whole sentence; this renders the whole sentence a conditional. The scope of &, on the other hand, is just $(B \,\&\, C)$. In (2), the scope of the quantifier ∀ is the whole sentence, which allows it to bind every occurrence of x. The scope of ∃ is only $\exists yAxy$. Since Bxy is outside its scope, the y in Bxy is left unbound.

SEARLE, JOHN (1932–)

John Searle was a pupil of J.L. Austin at Oxford in the 1950s. He is the Mills Professor of Mind and Language at the University of California, Berkeley, where he has taught philosophy since 1959. According to Searle, the primary objects of analysis in the philosophy of language are not expressions but the production of expressions, speech acts, in accordance with rules. Learning a language involves (often unconsciously) internalizing rules that govern the performance of speech acts in that language. Speech-act theory aims to discover these rules and is itself a part of action theory, which concerns intentional states directed at or about something. It follows that speech-act theory is part of a more comprehensive theory of intentionality.

ERNIE LEPORE

SECOND-ORDER LOGIC, PHILOSOPHICAL ISSUES IN

Typically, a formal language has variables that range over a collection of objects, or domain of discourse. A language is 'second-order' if it has, in addition, variables that range over sets, functions, properties or relations on the domain of discourse. A language is third-order if it has variables ranging over sets of sets, or functions on relations, and so on. A language is higher-order if it is at least second-order.

Second-order languages enjoy a greater expressive power than first-order languages. For example, a set S of sentences is said to be categorical if any two models satisfying S are isomorphic, that is, have the same structure. There are second-order, categorical characterizations of important mathematical structures, including the natural numbers, the real numbers and Euclidean space. It is a consequence of the Löwenheim–Skolem theorems that there is no first-order categorical characterization of any infinite structure. There are also a number of central mathematical notions, such as finitude, countability, minimal closure and well-foundedness, which can be characterized with formulas of second-order languages, but cannot be characterized in first-order languages.

Some philosophers argue that second-order logic is not logic. Properties and relations are too obscure for rigorous foundational study, while sets and functions are in the purview of mathematics, not logic; logic should not have an ontology of its own. Other writers disqualify second-order logic because its consequence relation is not effective – there is no recursively enumerable, sound and complete deductive system for second-order logic.

The deeper issues underlying the dispute concern the goals and purposes of logical theory. If a logic is to be a calculus, an effective canon of inference, then second-order logic is beyond the pale. If, on the other hand, one aims to codify a standard to which correct reasoning must adhere, and to characterize the descriptive and communicative abilities of informal mathematical practice, then perhaps there is room for second-order logic.

SELF-DECEPTION, ETHICS OF

Self-deception is complicated and perplexing because it concerns all major aspects of human nature, including consciousness, rationality, motivation, freedom, happiness, and value commitments. In a wide sense, 'self-deception' refers to intentional activities and motivated processes of avoiding unpleasant truths or topics and the resulting mental states of ignorance, false belief, unwarranted attitudes, and inappropriate emotions. Deceiving oneself, like deceiving other people, raises a host of questions about immorality. These include whether self-deception is always immoral or only when it conceals and supports wrongdoing; whether self-deception about wrongdoing and character faults compounds or mitigates guilt for causing harm; how important the value of authenticity is, and whether it can be sacrificed in an attempt to cope with reality; what the relation is between self-deception and responsibility; and whether groups can be self-deceived. Ultimately, the moral status of any instance of self-deception depends on the particular facts of the case.

MIKE W. MARTIN

SELLARS, WILFRID STALKER (1912–89)

Wilfrid Sellars was among the most systematic and innovative of post-war American philosophers. His critical destruction of the 'Myth of the Given' established him as a leading voice in the Anglo-American critique of 'the Cartesian concept of mind' and in the corresponding shift of attention from the categories of thought to public language. His own positive views were naturalistic, combining a robust scientific realism with a thoroughgoing nominalism which rejected both traditional abstract entities and ontologically primitive meanings. In their place, Sellars elucidated linguistic meaning and the content of thought in terms of a sophisticated theory of conceptual roles, instantiated in the linguistic conduct of speakers and transmitted by modes of cultural inheritance. He combined this theory with a form of 'verbal behaviourism' to produce the first version of functionalism in the contemporary philosophy of mind. Besides his profoundly original philosophical contributions, his long career as a distinguished teacher and influential editor earned him justified acclaim as one of the definitive figures of the post-war period.

SEMANTIC VIEW OF THEORIES

See Models; Theories, scientific

SEMANTICS

Semantics is the systematic study of meaning. Current work in this field builds on the work of logicians and linguists as well as of philosophers. Philosophers are interested in foundational issues in

semantics because these speak to the nature of meaning, as it embeds in our thinking and in our relations to each other and to the world. Of special interest are questions about how a semantic theory should respect the connections of meaning to truth and to understanding. In addition, numerous semantic problems concerning particular linguistic constructions bear philosophical interest, sometimes because the problems are important to resolving foundational semantical issues, sometimes because philosophical problems of independent interest are expressed using the constructions, and sometimes because clarity about the semantic function of the constructions enables clarity in the development of philosophical theories and analyses.

MARK CRIMMINS

SEMANTICS, CONCEPTUAL ROLE

According to conceptual role semantics (CRS), the meaning of a representation is the role of that representation in the cognitive life of the agent, for example, in perception, thought and decision-making. It is an extension of the well-known 'use' theory of meaning, according to which the meaning of a word is its use in communication and, more generally, in social interaction. CRS supplements external use by including the role of a symbol *inside* a computer or a brain. The uses appealed to are not just actual, but also counterfactual: not only what effects a thought *does* have, but what effects it *would* have had if stimuli or other states had differed. Of course, so defined, the functional role of a thought includes all sorts of causes and effects that are non-semantic, for example, perhaps happy thoughts can bolster one's immunity, promoting good health. Conceptual roles are functional roles minus such non-semantic causes and effects.

The view has arisen separately in philosophy (where it is sometimes called 'inferential' or 'functional' role semantics) and in cognitive science (where it is sometimes called 'procedural semantics').

NED BLOCK

SEMANTICS, GAME-THEORETIC

Game-theoretic semantics (GTS) uses concepts from game theory to study how the truth and falsity of the sentences of a language depend upon the truth and falsity of the language's atomic sentences (or upon its sub-sentential expressions). Unlike the Tarskian method (which uses recursion clauses to determine satisfaction conditions for nonatomic sentences in terms of the satisfaction conditions of their component sentences, then defines truth in terms of satisfaction), GTS associates with each sentence its own semantic game played on sentences of the language. This game defines truth in terms of the existence of a winning strategy for one of the players involved. The structure of the game is determined by the sentence's structure, and thus the semantic properties of the sentence in question can be studied by attending to the properties of its game.

MICHAEL HAND

SEMANTICS, POSSIBLE WORLDS

Possible worlds semantics (PWS) is a family of ideas and methods that have been used to analyse concepts of philosophical interest. PWS was originally focused on the important concepts of necessity and possibility. Consider:

(a) Necessarily, 2 + 2 = 4.
(b) Necessarily, Socrates had a snub nose.

Intuitively, (a) is true but (b) is false. There is simply no way that 2 and 2 can add up to anything but 4, so (a) is true. But although Socrates did in fact have a snub nose, it was not necessary that he did; he might have had a nose of some other shape. So (b) is false.

Sentences (a) and (b) exhibit a characteristic known as *intensionality*: sentences with the same truth-value are constituent parts of otherwise similar sentences, which nevertheless have different truth-values. *Extensional semantics* assumed that sentences stand for their truth-values, and that what a sentence stands for is a function of what its constituent parts stand for and how they are arranged. Given these assumptions, it is not easy to explain the difference in truth-value between (a) and (b), and hence not easy to give an account of necessity.

PWS takes a sentence to stand for a function from worlds to truth-values. For each world, the function yields the truth-value the sentence would have if that world were actual. Thus '2 + 2 = 4' stands for a function that yields the truth-value 'true' for every world, while 'Socrates had a snub nose' stands for a different function that yields 'true' for some worlds and 'false' for others, depending on what Socrates' nose is like in the world. Since these two sentences stand for different things, sentences that have them as constituents, such as (a) and (b), can also stand for different things.

This basic idea, borrowed from Leibniz and brought into modern logic by Carnap, Kripke and others, has proven extremely fertile. It has been applied to a number of intensional phenomena in addition to necessity and possibility, including conditionals, tense and temporal adverbs, obligation and reports of informational and cognitive content. PWS spurred the development of philosophical logic and led to new applications of logic in computer science and artificial intelligence. It revolutionized the study of the semantics of natural languages. PWS has inspired analyses of many concepts of philosophical importance, and the concept of a possible world has been at the heart of important philosophical systems.

JOHN R. PERRY

SEMANTICS, SITUATION

Situation semantics attempts to provide systematic and philosophically coherent accounts of the meanings of various constructions that philosophers and linguists find important. It is based on the old idea that sentences stand for facts or something like them. As such, it provides an alternative to extensional semantics, which takes sentences to stand for truth-values, and to possible worlds semantics, which takes them to stand for sets of possible worlds.

Situations are limited parts or aspects of reality, while states of affairs (or infons) are complexes of properties and objects of the sort suitable to constitute a fact. Consider the issue of whether Jackie, a dog, broke her leg at a certain time T. There are two states of affairs or possibilities: that she did or she did not. The situation at T, in the place where Jackie was then, determines which of these states of affairs (infons) is *factual* (or *is the case* or *is supported*). *Situation theory*, the formal theory that underlies situation semantics, focuses on the nature of the *supports* relation.

Situation semantics sees *meaning* as a relation among *types of situations*. The meaning of 'I am sitting next to David', for example, is a relation between types of situations in which someone A utters this sentence referring with the name 'David' to a certain person B, and those in which A is sitting next to B. This relational theory of meaning makes situation semantics well suited to treat indexicality, tense and other similar phenomena. It has also inspired relational accounts of information and action.

JOHN R. PERRY

SEMIOTICS

As the study of signification, semiotics takes as its central task that of describing how one thing can mean another. Alternatively, since this philosophical problem is also a psychological one, its job could be said to be that of describing how one thing can bring something else to mind, how on seeing '*x*' someone can be induced to think about '*y*' even though '*y*' is absent.

A person in whose head '*y*' has been brought to mind may be responding to an '*x*' someone else has transmitted with the intention of its signifying '*y*'; or, mistakenly, responding to an '*x*' someone has transmitted in the guileless expectation of its signifying some '*z*'; or, often, responding to an '*x*' that comes to his notice without anybody's apparent intention at all. Words, for example, generally signify because someone intends them to, and ideally (though not always) they signify what is intended; whereas clouds signify – a coming storm, a whale – because we so interpret them, not because they shaped themselves to convey some meaning.

Obviously the study of signification forms an integral part of the study of thinking, since no object can itself enter the brain, barring fatal mischance, and so it must be represented by some mental (that is, neural) '*x*' that signifies it.

Signifiers are equally essential for creatures far lower than humans, as when a chemical signal '*x*' emitted by some bacterium signifies to one of its colleagues some '*y*' such as 'There's a dearth of food hereabouts'.

There are a number of ways in which an '*x*' can signify some '*y*', but for humans these are chiefly: by physical association; by physical resemblance; and/or by arbitrary convention.

When we take some '*x*' as signifying some '*y*' we are often guessing; our guess is subject to checking by interpretative (re)appraisal.

SENSE AND FORCE

See Pragmatics

SENSE AND REFERENCE

The 'reference' of an expression is the entity the expression designates or applies to. The 'sense' of an expression is the way in which the expression presents that reference. For example, the ancients used 'the morning star' and 'the evening star' to designate what turned out to be the same heavenly body, the planet Venus. These two expressions have the same reference, but they clearly differ in that each presents that reference in a different way. So, although coreferential, each expression is associated

with a different 'sense'. The distinction between sense and reference helps explain the cognitive puzzle posed by identity statements. 'The morning star is the evening star' and 'The morning star is the morning star' are both true, yet the sentences differ in cognitive significance, since the former may be informative, whereas the latter definitely is not. That difference in cognitive significance cannot be explained just by appeal to the references of the terms, for those are the same. It can, however, be naturally accounted for by appeal to a difference in sense. The terms 'the morning star' and 'the evening star' used in the first sentence, having different senses, present the referent in different ways, whereas no such difference occurs in the second sentence.

The distinction between sense and reference applies to all well-formed expressions of a language. It is part of a general theory of meaning that postulates an intermediate level of sense between linguistic terms and the entities the terms stand for. Senses give significance to expressions, which in and of themselves are just noises or marks on a surface, and connect them to the world. It is because linguistic terms have a sense that they can be used to express judgments, to transmit information and to talk about reality.

GENOVEVA MARTÍ

SENSE PERCEPTION, INDIAN VIEWS OF

Sense perception is considered in classical Indian thought in the context of epistemological issues – in particular, perception as a source of knowledge – and of psychological and metaphysical issues, for example, the relations of sense experiences to objects, to language and to the perceiving self or subject. The Sanskrit word used most commonly in philosophical investigations of sense perception is *pratyakṣa*, a compound of *prati*, 'before', and *akṣa*, 'eye' or any 'organ of sense'; thus it should be understood as 'being before the eyes' or 'experientially evident' as an adjective, and 'immediate experience' or 'sense experience' as a noun. The meaning 'sense perception' is normal within philosophical inquiries. But just how many sense modalities there are is not to be taken for granted. In addition to the five types of sense experience commonly identified, 'mental' perception (as of pleasures, pains and desires), apperception (awareness of awareness) and extraordinary or yogic perception are sometimes counted as *pratyakṣa*.

Views about the psychology of perception or, more broadly, about perception considered as part of the world are developed in religious and soteriological literature (literature about enlightenment and liberation) predating classical philosophical discussions. In Upaniṣadic, Buddhist and Jaina texts over two millennia old, perception is painted in broad strokes within spiritual theories of self and world that promote ideas of the supreme value of a mystical experience. Sense perception is usually devalued comparatively. Later, the psychology of perception becomes very advanced and is treated in some quarters independently of soteriological teachings.

Classical Indian philosophy proper is marked by tight argumentation and self-conscious concern with evidence. The justificational value of perception is recognized from the outset, in so far as any justifiers, or knowledge sources, are admitted at all. Nāgārjuna and others challenge the epistemological projects of Nyāya and other positive approaches to knowledge, prompting deep probing of perception's epistemic role. Views about veridicality, fallibility and meaningful doubt become greatly elaborated.

What do we perceive? Throughout classical thought, sharp disagreements occur over the perceptibility of universals, relations, absences or negative facts (such as Devadatta's not being at home), parts versus wholes, and the self or awareness itself. Issues about perceptual media (such as light and ether, *ākāśa*, the purported medium of sound), about occult or spiritual perceptibles and about the very existence of objects independently of consciousness are hotly debated. A Buddhist phenomenalism is polemically matched by a Mīmāṃsā and Nyāya realism on a range of concerns.

Probably through the influence of mysticism, verbalization of experience, however simple and direct, becomes suspect in comparison with experience itself; this suspicion is evident in concerns over the value of each in presenting reality, as well as in other, sometimes rather indefinite, ways. The judgment is prevalent that what prevents a person from living in an enlightened or liberated state is thinking – verbalizing experience, calculating, planning, and so on – instead of having pure experience, perceptual and otherwise, and thus living with a 'silent mind'. This attitude emerges in treatments of sense experience, reinforcing what is perhaps a natural tendency among philosophers to find the relations of experience and language problematic. Even in the root text of Nyāya, where the influence of yoga and mysticism is not so strong, perception is said to be a cognition that is nonverbal, *avyapadeśya*, although there is considerable dispute about precisely what this means. The relations between various modes of experience and the language used with respect to them remains an ongoing concern of the very latest and most complex classical Indian philosophy.

STEPHEN H. PHILLIPS

SENSE-DATA

A philosophical theory of perception must accommodate this obvious fact: when someone perceives, or seems to perceive something, how things appear may differ from how they are. A circular coin tilted will look elliptical. A stick partially immersed in water will look bent. Noting that appearance and reality do not always coincide, some philosophers have given the following account of the contrast between the two. Suppose someone seems to see a book with a red cover. Whether or not there is any book to be seen, the individual seeming to see the red book will be aware of something red. What they are aware of is called a sense-datum. According to a sense-datum theory, any perceptual experience involves awareness of a sense-datum whether or not it is an experience of a physical object.

Some philosophers link a sense-datum theory with certain views about knowledge. According to foundationalists all knowledge of the external world must rest on a foundation of beliefs that are beyond doubt. We can always be mistaken about what physical objects are like. On the other hand, we cannot be mistaken about what sense-data are like. So, all knowledge about the external world rests on beliefs about sense-data. In this way a sense-datum theory is supposed to do double duty in contributing towards an account of perception, and an account of knowledge based on perception.

SET THEORETIC PARADOXES

See PARADOXES OF SET AND PROPERTY

SET THEORY

In the late nineteenth century, Georg Cantor created mathematical theories, first of sets or aggregates of real numbers (or linear points), and later of sets or aggregates of arbitrary elements. The relationship of element a to set A is written $a \in A$; it is to be distinguished from the relationship of subset B to set A, which holds if every element of B is also an element of A, and which is written $B \subseteq A$. Cantor is most famous for his theory of transfinite cardinals, or numbers of elements in infinite sets. A subset of an infinite set may have the same number of elements as the set itself, and Cantor proved that the sets of natural and rational numbers have the same number of elements, which he called $\aleph_0$; also that the sets of real and complex numbers have the same number of elements, which he called **c**. Cantor proved $\aleph_0$ to be less than **c**. He conjectured that no set has a number of elements strictly between these two.

In the early twentieth century, in response to criticism of set theory, Ernst Zermelo undertook its axiomatization; and, with amendments by Abraham Fraenkel, his have been the accepted axioms ever since. These axioms help distinguish the notion of a set, which is too basic to admit of informative definition, from other notions of a one made up of many that have been considered in logic and philosophy. Properties having exactly the same particulars as instances need not be identical, whereas sets having exactly the same elements are identical by the axiom of extensionality. Hence for any condition Φ there is at most one set $\{x|\Phi(x)\}$ whose elements are all and only those x such that $\Phi(x)$ holds, and $\{x|\Phi(x)\} = \{x|\Psi(x)\}$ if and only if conditions Φ and Ψ hold of exactly the same x. It cannot consistently be assumed that $\{x|\Phi(x)\}$ exists for every condition Φ. Inversely, the existence of a set is not assumed to depend on the possibility of defining it by some condition Φ as $\{x|\Phi(x)\}$.

One set x_0 may be an element of another set x_1 which is an element of x_2 and so on, $x_0 \in x_1 \in x_2 \in \ldots$, but the reverse situation, $\ldots \in y_2 \in y_1 \in y_0$, may not occur, by the axiom of foundation. It follows that no set is an element of itself and that there can be no universal set $y = \{x|x = x\}$. Whereas a part of a part of a whole is a part of that whole, an element of an element of a set need not be an element of that set.

Modern mathematics has been greatly influenced by set theory, and philosophies rejecting the latter must therefore reject much of the former. Many set-theoretic notations and terminologies are encountered even outside mathematics, as in parts of philosophy:

pair	$\{a,b\}$	$\{x|x = a \text{ or } x = b\}$
singleton	$\{a\}$	$\{x|x = a\}$
empty set	$\emptyset$	$\{x|x \neq x\}$
union	$\cup X$	$\{a|a \in A \text{ for some } A \in X\}$
binary union	$A \cup B$	$\{a|a \in A \text{ or } a \in B\}$
intersection	$\cap X$	$\{a|a \in A \text{ for all } A \in X\}$
binary intersection	$A \cap B$	$\{a|a \in A \text{ and } a \in B\}$
difference	$A - B$	$\{a|a \in A \text{ and not } a \in B\}$
complement	$A - B$	
power set	$\wp(A)$	$\{B|B \subseteq A\}$

(In contexts where only subsets of A are being considered, $A - B$ may be written $-B$ and called the complement of B.)

While the accepted axioms suffice as a basis for the development not only of set theory itself, but of

modern mathematics generally, they leave some questions about transfinite cardinals unanswered. The status of such questions remains a topic of logical research and philosophical controversy.

SEXTUS EMPIRICUS (*fl. c.* AD 200)

Sextus Empiricus is our major surviving source for Greek scepticism. Three works of his survive: a general sceptical handbook (*Outlines of Pyrrhonism*), a partly lost longer treatment of the same material, and a series of self-contained essays questioning the utility of the individual liberal arts.

R.J. HANKINSON

SEXUALITY, PHILOSOPHY OF

The philosophy of sexuality, like the philosophy of science, art or law, is the study of the concepts and propositions surrounding its central protagonist, in this case 'sex'. Its practitioners focus on conceptual, metaphysical and normative questions.

Conceptual philosophy of sex analyses the notions of sexual desire, sexual activity and sexual pleasure. What makes a feeling a sexual sensation? Manipulation of and feelings in the genitals are not necessary, since other body parts yield sexual pleasure. What makes an act sexual? A touch on the arm might be a friendly pat, an assault, or sex; physical properties alone do not distinguish them. What is the conceptual link between sexual pleasure and sexual activity? Neither the intention to produce sexual pleasure nor the actual experience of pleasure seems necessary for an act to be sexual. Other conceptual questions have to do not with what makes an act sexual, but with what makes it the type of sexual act it is. How should 'rape' be defined? What the conceptual differences are, if any, between obtaining sex through physical force and obtaining it by offering money is an interesting and important issue.

Metaphysical philosophy of sex discusses ontological and epistemological matters: the place of sexuality in human nature; the relationships among sexuality, emotion and cognition; the meaning of sexuality for the person, the species, the cosmos. What is sex all about, anyway? That sexual desire is a hormone-driven instinct implanted by a god or nature acting in the service of the species, and that it has a profound spiritual dimension, are two – not necessarily incompatible – views. Perhaps the significance of sexuality is little different from that of eating, breathing and defecating; maybe, or in addition, sexuality is partially constitutive of moral personality.

Normative philosophy of sex explores the perennial questions of sexual ethics. In what circumstances is it morally permissible to engage in sexual activity or experience sexual pleasure? With whom? For what purpose? With which body parts? For how long? The historically central answers come from Thomist natural law, Kantian deontology, and utilitarianism. Normative philosophy of sex also addresses legal, social and political issues. Should society steer people in the direction of heterosexuality, marriage, family? May the law regulate sexual conduct by prohibiting prostitution or homosexuality? Normative philosophy of sex includes nonethical value questions as well. What is good sex? What is its contribution to the good life?

The breadth of the philosophy of sex is shown by the variety of topics it investigates: abortion, contraception, acquaintance rape, pornography, sexual harassment, and objectification, to name a few. The philosophy of sex begins with a picture of a privileged pattern of relationship, in which two adult heterosexuals love each other, are faithful to each other within a formal marriage, and look forward to procreation and family. Philosophy of sex, as the Socratic scrutiny of our sexual practices, beliefs and concepts, challenges this privileged pattern by exploring the virtues, and not only the vices, of adultery, prostitution, homosexuality, group sex, bestiality, masturbation, sadomasochism, incest, paedophilia and casual sex with anonymous strangers. Doing so provides the same illumination about sex that is provided when the philosophies of science, art and law probe the privileged pictures of their own domains.

SHAME

See Moral sentiments

SHINTŌ

Shintō means the 'way of the *kami* (gods)' and is a term that evolved about the late sixth or early seventh century – as Japan entered an extended period of cultural borrowing from China and Korea – to distinguish the amalgam of native religious beliefs from Buddhism, a continental import. Shintō embraces the most ancient and basic social and religious values of Japan. It is exclusively Japanese, showing no impulse to spread beyond Japan. The exportation of Shintō would in

any case be exceedingly difficult since its mythology is so closely bound to the creation of Japan and the Japanese people, and since many of its deities are believed to make their homes in the mountains, rivers, trees, rocks and other natural features of the Japanese islands.

Shintō comprises both great and little traditions. The great tradition, established in the mythology that was incorporated into Japan's two oldest extant writings, *Kojiki* (Record of Ancient Matters) and *Nihon Shoki* (Chronicle of Japan), both dating from the early eighth century, is centred on the imperial institution. According to the mythology the emperorship was ordained by the sun goddess, Amaterasu, who sent her grandson from heaven to earth (Japan) to found a dynasty 'to rule eternally'. The present emperor is the 125th in a line of sovereigns officially regarded, until Japan's defeat in the Second World War, as descended directly from Amaterasu.

Shintō's little tradition is a mixture of polytheistic beliefs about *kami*, manifested in nature worship (animism), ancestor worship, agricultural cults, fertility rites, shamanism and more. Lacking a true scriptural basis, Shintō derives from the faith of the people, and from earliest times has had its roots firmly planted in particularistic, localistic practices. Thus it has always been strongest in its association with such entities as families, villages and locales (for example, mountains thought to be the homes of certain *kami* or, indeed, to be the *kami* themselves).

PAUL VARLEY

SIDGWICK, HENRY (1838–1900)

Henry Sidgwick was a Cambridge philosopher, psychic researcher and educational reformer, whose works in practical philosophy, especially *The Methods of Ethics* (1874), brought classical utilitarianism to its peak of theoretical sophistication and drew out the deep conflicts within that tradition, perhaps within the age of British imperialism itself. Sidgwick was profoundly influenced by J.S. Mill, but his version of utilitarianism – the view that those social or individual actions are right that maximize aggregate happiness – also revived certain Benthamite doctrines, though with more cogent accounts of ultimate good as pleasure, of total versus average utility, and of the analytical or deductive method. Yet Sidgwick was a cognitivist in ethics who sought both to ground utilitarianism on fundamental intuitions and to encompass within it the principles of common-sense ethics (truthfulness, fidelity, justice, etc.); his highly eclectic practical philosophy assimilated much of the rationalism, social conservatism and historical method of rival views, reflecting such influences as Butler, Clarke, Aristotle, Bagehot, Green, Whewell and Kant. Ultimately, Sidgwick's careful academic inquiries failed to demonstrate that one ought always to promote the happiness of all rather than one's own happiness, and this dualism of practical reason, along with his doubt about the viability of religion, led him to view his results as largely destructive and potentially deleterious in their influence.

BART SCHULTZ

SIMMEL, GEORG (1858–1918)

Georg Simmel was a prolific German philosopher and sociologist, who was one of the principal founders of sociology in Germany. His philosophy and social theory had a major impact in the early decades of the twentieth century, both among professional philosophers and sociologists and within the cultural and artistic spheres. This is true of his foundation for sociology, his philosophy of art and culture, his philosophy of life and his philosophy of money. His thought ranged from substantive issues within the philosophical tradition to a concern with the everyday world and its objects.

SIMPLE TYPE THEORY

See Theory of types

SIMPLICITY (IN SCIENTIFIC THEORIES)

In evaluating which of several competing hypotheses is most plausible, scientists often use simplicity as a guide. This raises three questions: What makes one hypothesis simpler than another? Why should a difference in simplicity make a difference in what we believe? And how much weight should simplicity receive, compared with other considerations, in judging a hypothesis' plausibility? These may be termed the descriptive, the normative, and the weighting problems, respectively. The aesthetic and pragmatic appeal of more simple theories is transparent; the puzzle is how simplicity can be a guide to truth.

SIMULATION THEORY

Mental simulation is the simulation, replication or re-enactment, usually in imagination, of the thinking, decision-making, emotional responses or other aspects of the mental life of another person. According to simulation theory, mental simulation in imagination plays a key role in our everyday psychological understanding of other people. The same mental resources that are used in our own thinking, decision-making or emotional responses are redeployed in imagination to provide an understanding of the thoughts, decisions or emotions of another.

Simulation theory stands opposed to the 'theory theory' of folk psychology. According to the theory theory, everyday psychological understanding depends on deployment of an empirical theory or body of information about psychological matters, such as how people normally think, make decisions or respond emotionally. Simulation theory does not altogether deny that third-personal psychological knowledge is implicated in our folk psychological practice, prediction, interpretation and explanation. But it maintains that, over a range of cases, the first-personal methodology of mental simulation allows us to avoid the need for detailed antecedent knowledge about how psychological processes typically operate.

SIN

The most archaic conception of human fault may be the notion of defilement or pollution, that is, a stain or blemish which somehow infects a person from without. All the major religious traditions offer accounts of human faults and prescriptions for dealing with them. However, it is only when fault is conceived within the context of a relationship to a personal deity that it makes sense to speak of it as an offence against the divine will. The concept of sin is the concept of a human fault that offends a good God and brings with it human guilt. Its natural home is in the major theistic religions of Judaism, Christianity and Islam.

These religious traditions share the idea that actual or personal sins are individual actions contrary to the will of God. In the Hebrew Bible, sin is understood within the context of the covenantal relation between Yahweh and his chosen people. To be in covenant with Yahweh is to exist in holiness, and so sin is a deviation from the norms of holiness. In the Christian New Testament, Jesus teaches that human wrongdoing offends the one whom he calls Father. The Qur'an portrays sin as opposition to Allah rooted in human pride.

According to Christian tradition, there is a distinction to be drawn between actual sin and original sin. The scriptural warrant for the doctrine of original sin is found in the Epistles of Paul, and the interpretation of Paul worked out by Augustine in the course of his controversy with the Pelagians has been enormously influential in Western Christianity. On the Augustinian view, which was developed by Anselm and other medieval thinkers with considerable philosophical sophistication, the Fall of Adam and Eve had catastrophic consequences for their descendants. All the progeny of the first humans, except for Jesus and his mother, inherit from them guilt for their first sin, and so all but two humans are born bearing a burden of guilt. The Augustinian doctrine of original sin is morally problematic just because it attributes innate guilt to humans. It was criticized by John Locke and Immanuel Kant.

SITUATION ETHICS

'Situation ethics' accords morally decisive weight to particular circumstances in judging whether an action is right or wrong. Thus we should examine critically all traditional rules prohibiting kinds of actions. Proponents of these views have exerted their greatest influence in Europe and North America in the twentieth century, although such influence had waned by 1980. The views received extensive scrutiny in Christian communities. Three quite different warrants were offered for privileging discrete situations. First, we should remain dispositionally open to God's immediate command in a particular time and place (theological contextualism).

Second, we should take the actual consequences of particular actions as morally decisive (empirical situationism). Third, we should be ready to perform actions that compromise moral ideals when doing so improves matters in ways a given situation, with its distinctive constraints, makes viable (mournful realism).

SLAVERY

The moral, economic and political value of slavery has been hotly disputed by philosophers since ancient times. It was defended as an institution by Plato and Aristotle, but became increasingly subject to attack in the modern period, until its general abolition in the Western world in the nineteenth century.

In the twentieth century our belief that slavery is fundamentally unjust has become a benchmark against which moral and political philosophies may be tested. Both utilitarians and contractarian philosophers have argued against slavery in general and the enforceability of slavery contracts more specifically, although for very different moral reasons. Others have argued that only by viewing slavery from the standpoint of the slave can its moral significance be understood.

STEPHEN L. ESQUITH
NICHOLAS D. SMITH

SMITH, ADAM (1723–90)

Despite his reputation as the founder of political economy, Adam Smith was a philosopher who constructed a general system of morals in which political economy was but one part. The philosophical foundation of his system was a Humean theory of imagination that encompassed a distinctive idea of sympathy. Smith saw sympathy as our ability to understand the situation of the other person, a form of knowledge that constitutes the basis for all assessment of the behaviour of others. Our spontaneous tendency to observe others is inevitably turned upon ourselves, and this is Smith's key to understanding the moral identity of the individual through social interaction. On this basis he suggested a theory of moral judgment and moral virtue in which justice was the key to jurisprudence. Smith developed an original theory of rights as the core of 'negative' justice, and a theory of government as, primarily, the upholder of justice. But he maintained the political significance of 'positive' virtues in a public, non-governmental sphere. Within this framework he saw a market economy developing as an expression of humanity's prudent self-interest. Such self-interest was a basic feature of human nature and therefore at work in any form of society; but commercial society was special because it made the pursuit of self-interest compatible with individual liberty; in the market the poor are not personally dependent upon the rich. At the same time, he recognized dangers in commercial society that needed careful institutional and political management. Smith's basic philosophy is contained in *The Theory of Moral Sentiments* (1759), but a major part concerning law and government was never completed to Smith's satisfaction and he burnt the manuscript before he died. Consequently the connection to the *Wealth of Nations* (1776) can only be partially reconstructed from two sets of students' notes (1762–3 and 1763–4) from his *Lectures on Jurisprudence* at Glasgow. These writings are complemented by a volume of essays and student notes from lectures on rhetoric and belles-lettres.

Although a philosopher of public life and in some measure a public figure, Adam Smith adhered to the Enlightenment ideal of privacy to a degree rarely achieved by his contemporaries. He left no autobiographical accounts and, given his national and international fame, the surviving correspondence is meagre. The numerous eyewitness reports of him mostly relate particular episodes and individual traits of character. Just as there are only a few portraits of the man's appearance, there are no extensive accounts of the personality, except Dugald Stewart's 'Life of Adam Smith' (1793), written after Smith's death and designed to fit Stewart's eclectic supplementation of common sense philosophy. While Smith was a fairly sociable man, his friendships were few and close only with men who respected his desire for privacy. David Hume was pre-eminent among them.

SOCIAL CHOICE

Social choice theory is the branch of economics concerned with the relationships between individual values, preferences and rights and collective

decision making and evaluation. Social choice theory therefore provides connections between the formal analysis of rational choice, the debate on political process, and ethics. A central theme in social choice theory has been the aggregation of individual preferences into either a social decision rule or a social evaluation rule. The most famous result in social choice theory – Arrow's impossibility theorem – is that such aggregation is impossible if individual preferences are conceived as ordinal in nature, and if the aggregation procedure is to satisfy certain apparently reasonable conditions. This result implies that neither a voting system nor a system of moral evaluation can be found that satisfies all of the required conditions. Further impossibility theorems arise from attempts to model the role of individual rights.

Much of social choice theory is concerned with interpreting, extending and questioning these impossibility theorems in a variety of contexts. This discussion has generated an extensive interchange at the margins of economics and ethics on topics such as the commensurability of values and the relationship between morality and rationality.

SOCIAL DEMOCRACY

The idea of social democracy is now used to describe a society the economy of which is predominantly capitalist, but where the state acts to regulate the economy in the general interest, provides welfare services outside of it and attempts to alter the distribution of income and wealth in the name of social justice. Originally 'social democracy' was more or less equivalent to 'socialism'. But since the mid-twentieth century, those who think of themselves as social democrats have come to believe that the old opposition between capitalism and socialism is outmoded; many of the values upheld by earlier socialists can be promoted by reforming capitalism rather than abolishing it.

Although it bases itself on values like democracy and social justice, social democracy cannot really be described as a political philosophy: there is no systematic statement or great text that can be pointed to as a definitive account of social democratic ideals. In practical politics, however, social democratic ideas have been very influential, guiding the policies of most Western states in the post-war world.

SOCIAL EPISTEMOLOGY

Social epistemology is the conceptual and normative study of the relevance to knowledge of social relations, interests and institutions. It is thus to be distinguished from the sociology of knowledge, which is an empirical study of the contingent social conditions or causes of what is commonly taken to be knowledge. Social epistemology revolves around the question of whether knowledge is to be understood individualistically or socially.

Epistemology has traditionally ascribed a secondary status to beliefs indebted to social relations – to testimony, expert authority, consensus, common sense and received wisdom. Such beliefs could attain the status of knowledge, if at all, only by being based on first-hand knowledge – that is, knowledge justified by the experience or reason of the individual knower.

Since the work of the common sense Scottish philosopher Thomas Reid in the mid-eighteenth century, epistemologists have from time to time taken seriously the idea that beliefs indebted to social relations have a primary and not merely secondary epistemic status. The bulk of work in social epistemology has, however, been done since Thomas Kuhn depicted scientific revolutions as involving social changes in science. Work on the subject since 1980 has been inspired by the 'strong programme' in the sociology of science, by feminist epistemology and by the naturalistic epistemology of W.V. Quine. These influences have inspired epistemologists to rethink the role of social relations – especially testimony – in knowledge. The subject that has emerged may be divided into three branches: the place of social factors in the knowledge possessed by individuals; the organization of individuals' cognitive labour; and the nature of collective knowledge, including common sense, consensus and common, group, communal and impersonal knowledge.

FREDERICK F. SCHMITT

SOCIAL RELATIVISM

People in different societies have very different beliefs and systems of belief. To understand such

diversity is a prime task of the student of society. The task is especially pressing when alien beliefs seem obviously mistaken, unreasonable or otherwise peculiar. A popular response is social relativism. Perhaps beliefs which seem mistaken, unreasonable or peculiar viewed from our perspective, are by no means mistaken, unreasonable or peculiar viewed from the perspective of the society in which they occur. Different things are not just thought true (reasonable, natural) in different societies – rather, they are true (reasonable, natural) in different societies. Relativism recognizes diversity and deals with it even-handedly.

Relativism has absurd results. Consider the view that what is true in society A need not be true in society B. So if society A believes in witches while society B does not, there are witches in A but not in B. Relativism regarding truth drives us to different 'worlds', one with witches in it and another without. This seems absurd: people who live in different societies do not in any literal sense live in different worlds. The challenge is to do justice to social diversity without falling into absurdities such as this.

ALAN MUSGRAVE

SOCIAL SCIENCE, CONTEMPORARY PHILOSOPHY OF

Some philosophers think that the study of social phenomena must apply methods from natural science. Researchers should discover causal regularities (whenever C operates, E occurs) and fit them into systematic theories. Some philosophers hold that social phenomena call for an entirely different approach, in which researchers seek to interpret fully the meaning of people's actions, including their efforts to communicate and cooperate. On this view, the nearest that researchers will come to regularities will be to discover rules (whenever the situation is S, everyone must do A). The nearest that they will get to systematic theories will be systematic expositions of rules, like the rules of a kinship system.

Besides the naturalistic school and the interpretive school, the philosophy of social science harbours a critical school. This finds researches endorsed by the other two schools shot through with bias. It inclines to agree with the interpretive school in resisting naturalistic methods. However, its charges against naturalistic researches extend to interpretations. For interpretations may give untroubled pictures of societies in deep trouble, or picture the trouble in ways that serve the interests of the people who profit from it, for example, by leaving current rules about taking workers on and laying them off unquestioned. Here the critical school may itself use naturalistic methods. If it contends that ignoring ways of reassigning authority over employment increases the chances of private enterprises' retaining their present authority, the critical school is talking about a causal connection. There is no rule that says anyone must increase the chances.

Yet the researches sponsored by the three schools are complementary to the degree that researches into regularities and into rules are complementary. Settled social rules have counterparts in causal regularities, which may be expressed in similar terms, although the evidence for regularities need not include intended conformity. Some regularities are not counterparts of rules, but involve rules notwithstanding. If the proportion of marriages in Arizona ending in divorce is regularly one-third, that is not (as it happens) because one-third of Arizonans who marry must divorce. Yet marriage and divorce are actions that fall under rules.

The three schools do more than endorse studies of rules or regularities. The critical school denies that any study of social phenomena can be value-free, in particular on the point of emancipating people from the oppressions of current society. Either researchers work with the critical school to expose oppression; or they work for the oppressors. The interpretive school brings forward subjective features of human actions and experiences that overflow the study of rules. These features, too, may be reported or ascribed correctly or incorrectly; however, the truth about them may be best expressed in narrative texts more or less elaborate.

Postmodernism has generalized these themes in a sceptical direction. Every text can be read in multiple, often conflicting, ways, so there are always multiple, often conflicting, interpretations of whatever happens. Every interpretation serves a quest for power, whether or not it neatly favours or disfavours an oppressive social class. Such contentions undermine assumptions that the three schools make about seeking truth regarding social phenomena. They do even more to undermine any assumption that the truths found will hold universally.

The assumption about universality, however, is a legacy of the positivist view of natural science. Positivism has given way to the model-theoretic or semantic view that science proceeds by constructing models to compare with real systems. A model – in social science, a model of regularities or one of rules – that fits any real system for a time is a scientific achievement empirically vindicated. Renouncing demands for universality, the philosophy of social

science can make a firm stand on issues raised by postmodernism. It can accept from postmodernists the point that scientific success happens in local contexts and only for a time; but resist any further-reaching scepticism.

DAVID BRAYBROOKE

SOCIAL SCIENCE, METHODOLOGY OF

Each of the sciences, the physical, biological, social and behavioural, have emerged from philosophy in a process that began in the time of Euclid and Plato. These sciences have left a legacy to philosophy of problems that they have been unable to deal with, either as nascent or as mature disciplines. Some of these problems are common to all sciences, some restricted to one of the four general divisions mentioned above, and some of these philosophical problems bear on only one or another of the special sciences.

If the natural sciences have been of concern to philosophers longer than the social sciences, this is simply because the former are older disciplines. It is only in the last century that the social sciences have emerged as distinct subjects in their currently recognizable state. Some of the problems in the philosophy of social science are older than these disciplines, in part because these problems have their origins in nineteenth-century philosophy of history. Of course the full flowering of the philosophy of science dates from the emergence of the logical positivists in the 1920s. Although the logical positivists' philosophy of science has often been accused of being satisfied with a one-sided diet of physics, in fact their interest in the social sciences was at least as great as their interest in physical science. Indeed, as the pre-eminent arena for the application of prescriptions drawn from the study of physics, social science always held a place of special importance for philosophers of science.

Even those who reject the role of prescription from the philosophy of physics cannot deny the relevance of epistemology and metaphysics for the social sciences. Scientific change may be the result of many factors, only some of them cognitive. However, scientific advance is driven by the interaction of data and theory. Data controls the theories we adopt and the direction in which we refine them. Theory directs and constrains both the sort of experiments that are done to collect data and the apparatus with which they are undertaken: research design is driven by theory, and so is methodological prescription. But what drives research design in disciplines that are only in their infancy, or in which for some other reason, there is a theoretical vacuum? In the absence of theory how does the scientist decide on what the discipline is trying to explain, what its standards of explanatory adequacy are, and what counts as the data that will help decide between theories? In such cases there are only two things scientists have to go on: successful theories and methods in other disciplines which are thought to be relevant to the nascent discipline, and the epistemology and metaphysics which underwrites the relevance of these theories and methods. This makes philosophy of special importance to the social sciences. The role of philosophy in guiding research in a theoretical vacuum makes the most fundamental question of the philosophy of science whether the social sciences can, do, or should employ to a greater or lesser degree the same methods as those of the natural sciences? Note that this question presupposes that we have already accurately identified the methods of natural science. If we have not yet done so, the question becomes largely academic. For many philosophers of social science the question of what the methods of natural science are was long answered by the logical positivist philosophy of physical science. And the increasing adoption of such methods by empirical, mathematical, and experimental social scientists raised a second central question for philosophers: why had these methods so apparently successful in natural science been apparently far less successful when self-consciously adapted to the research agendas of the several social sciences?

One traditional answer begins with the assumption that human behaviour or action and its consequences are simply not amenable to scientific study, because they are the results of free will, or less radically, because the significant kinds or categories into which social events must be classed are unique in a way that makes non-trivial general theories about them impossible. These answers immediately raise some of the most difficult problems of metaphysics and epistemology: the nature of the mind, the thesis of determinism, and the analysis of causation. Even less radical explanations for the differences between social and natural sciences raise these fundamental questions of philosophy.

Once the consensus on the adequacy of a positivist philosophy of natural science gave way in the late 1960s, these central questions of the philosophy of social science became far more difficult ones to answer. Not only was the benchmark of what counts as science lost, but the measure of progress became so obscure that it was no longer uncontroversial to claim that the social

sciences' rate of progress was any different from that of natural science.

ALEX ROSENBERG

SOCIAL SCIENCES, PHILOSOPHY OF

Introduction

Although some of the topics and issues treated in the philosophy of social science are as old as philosophy itself (for example, the contrast between nature and convention and the idea of rationality are dealt with by Aristotle), the explicit emergence of a subdiscipline of philosophy with this name is a very recent phenomenon, which in turn may itself have stimulated greater philosophical activity in the area. Clearly, this emergence is tied to the development and growth of the social sciences themselves.

1 Historical approach

There are, perhaps, four distinct ways in which to gain an understanding of the subdiscipline. These ways are, of course, complementary. First, just as with most other areas of philosophy, one might approach the philosophy of the social sciences historically, by studying major schools or philosophers of an earlier period. There is much to recommend this approach. There are a number of classical texts (by Weber and Durkheim, for example) of which any interested student of the philosophy of the social sciences should be aware, much as there is in epistemology or ethics. This provides an interesting contrast with the philosophy of the natural sciences; far less could be said in favour of gaining an understanding of the latter in this way.

Compared with other areas of philosophy, the history of the philosophy of the social sciences is somewhat truncated, since it can only begin properly with the earliest attempts at social science, in the late eighteenth and early nineteenth centuries, first in the Scottish Enlightenment and subsequently in Germany. Prior to this period, there had been speculation about the nature of society, some of it quite rich and rewarding (Hobbes and Vico provide two examples of this), but it is only in the period of the Scottish Enlightenment and after that writers begin to reflect the first systematic attempts to study and understand society.

There is no clear line of demarcation between philosophers of social science and of society on the one hand and social theorists on the other, especially in this early period. Conventionally, to select only a few examples, G.W.F. Hegel, Wilhelm Dilthey, F.H. Bradley and T.H. Green are considered to be examples of the former, and Adam Smith, Karl Marx, Émile Durkheim, and Max Weber, examples of the latter, but the line is sometimes somewhat arbitrary.

2 Problems

A second way in which to gain an understanding of the philosophy of social science is through the study of the issues and problems that these writers, and their contemporary counterparts, address (see Social science, methodology of). Many of these problems arise in ordinary as well as in more scientific discussions of and thought about the social realm. It is not only social scientists who think about the social world; all of us do, a great deal of the time. Even in those cases in which the social scientist introduces neologisms, for example, 'demand curves' or 'anomie', they seem closely connected to, and sometimes only a refinement of, concepts already grasped by the lay person.

This nonscientific reflection arises quite apart from any specialized scientific work. It is, to a certain extent, misleading to think of the field as only the philosophy of the social *sciences*. Since so much of the motivation for critical discussion of the problems in this area comes from philosophical reflection on these quite ordinary modes of thought and understanding, the field should perhaps be called 'the philosophy of *society*', to reflect this nonscientific, as well as the scientific, interest in those problems.

Most of the things that social science is about, social structures (like families or society itself), norms and rules of behaviour, conventions, specific sorts of human action, and so on, are items that find a place in the discourse of the ordinary lay person who has as good a grasp of common talk about social class and purchase, voting and banking, as does the social scientist. This raises, in a direct way, metaphysical questions about the nature of these things. Are these social structures anything more than just individuals and their interrelations? Many philosophers, in the grip of the ideal of the unity of science, have held out the prospect that social science can be derived from, and is therefore reducible to, psychology (the latter eventually being reducible to chemistry and physics). For

such thinkers, the world is ultimately a simple place, with only many different ways in which to speak about it. Other thinkers have been struck by the reality and integrity of the social world, and how it seems to impress itself on the individual willy-nilly (see SOCIETY, CONCEPT OF; HOLISM AND INDIVIDUALISM IN HISTORY AND SOCIAL SCIENCE).

What is an action, and how does it differ from the mere movement of one's body? It seems hard to say in what this difference consists in a way that remains plausible and true to what action is like. Whatever an action is, what makes some actions *social* actions? One might think that an action is social in virtue of its causal consequences on others. Another line of thought holds that an action is social in virtue of its intrinsic character, quite apart from the question of its effects. Much of the philosophical discussion of action arose in the philosophy of history, over the explanation of historically important action, but has now been absorbed into a separate area of philosophy, the theory of action (see HISTORY, PHILOSOPHY OF; ACTION; SOCIAL ACTION).

The alleged contrast between nature and convention occurs to those who think about humankind and its development, whether they be scientists and philosophers or not. Anyone who has travelled widely and noticed the social differences between peoples and cultures may have wondered whether all social practice was rational in its own terms, wherever found and no matter how apparently peculiar by our home-grown standards. Or perhaps, on the other hand, there are some universal standards of rationality, in the light of which evaluation of social practices and criticism of some of them can be mounted (see NATURE AND CONVENTION; RATIONALITY AND CULTURAL RELATIVISM; SOCIAL RELATIVISM).

The relationship between scientific theory and ordinary modes of thought is, of course, interactive, since many of the concepts or issues that have become part of ordinary lore have their roots in earlier scientific theory (our modern, and by most accounts, confused, concept of race might be an example of this).

Another set of problems arise in thinking through the nature of the social scientific enterprise itself. What standards must full explanation in social science meet? Causal explanation is a mode of explanation in natural science that is, relatively speaking, well understood. Explanations of a ritual or practice in society do not appear to be causal explanations, nor do explanations of human action. The first are often functional explanations (for example, a certain ritual exists because it produces such-and-such) and this appears to be an explanation of something by its effects rather than by its causes. Explanations of human action are intentional explanations, whereby an action is explained by the goal or end at which it is directed. This also appears not to be causal. But perhaps appearances are deceptive, and these can be recast as causal explanations after all (see EXPLANATION IN HISTORY AND SOCIAL SCIENCE).

Natural scientists believe that their work is ethically neutral. To be sure, their work can be put to good and bad uses, but this presumably reflects on the users rather than on the content of the science itself. The relationship between social science and the values of the social scientist seems far more immediate and direct than this, and this alleged contrast has been the subject for continuing discussion and debate.

Is social science like natural science in important ways? In the developed natural sciences, there are controlled experiments and predictions. Neither seem available to the social scientist. Natural scientists attempt to formulate the laws that govern the phenomena they study. Is this a reasonable goal for the social scientist? Certainly, there are not many candidate laws for the social sciences one can think of. Does the social scientist use statistical evidence in the same way as the natural scientist? (See STATISTICS AND SOCIAL SCIENCE.) Finally, in natural science, we distinguish between theory and observation in a relatively sharp way, and we believe that a rational person should accept that theory which is best confirmed by observations. It is not clear that we can make the same distinction in the social sciences, nor that theory is supported by observation in just the same way. Our observations of the social world seem even more coloured by the theory we employ than is the case in the natural sciences.

3 Contemporary movements

A third way in which to approach the subject is through the study of either contemporary movements and schools of philosophy, or specific philosophers, who bring a specific slant to the subdiscipline. Controversy marks the natural as well as the social sciences, but observers have noted that there seems to be even less consensus, even less of an agreed paradigm at any particular time, in the latter than in the former.

Critical reflection on society, or on social science, or both, is very different in France and Germany from the way it is in the English-speaking world. The problems are the same, but the traditions and the manner in which the discussions proceed are markedly distinctive. The hope is that each tradition may learn something from the other (see SOCIAL SCIENCE, CONTEMPORARY PHILOSOPHY OF; CRITICAL

REALISM; MACINTYRE, A.; NATURALISM IN SOCIAL SCIENCE; POSITIVISM IN THE SOCIAL SCIENCES; SOCIOLOGY OF KNOWLEDGE; STRUCTURALISM IN SOCIAL SCIENCE).

4 Specific social sciences

Fourth and finally, one might approach the philosophy of the social sciences by studying the philosophical problems that arise specifically within each of the social sciences. Some, although not all, of the social sciences have thrown up philosophical industries of their own. Economics is the most salient example. In many ways, it is the most developed of all the social sciences, and this may be the reason why some of the best-defined controversies in the philosophy of social science arise from within it. Questions about the philosophical foundations of economics touch on the philosophically central issues of rationality, choice and the nature of wants or desires and their connection with action (see ECONOMICS, PHILOSOPHY OF; SOCIAL CHOICE; RATIONAL CHOICE THEORY). But other social sciences have also given rise to specific problems, including history, psychology, sociology and anthropology (see ANTHROPOLOGY, PHILOSOPHY OF).

DAVID-HILLEL RUBEN

SOCIAL THEORY AND LAW

Social theory embodies the claim that philosophical analyses, reflections on specific historical experience and systematic empirical observations of social conditions may be combined to construct theoretical explanations of the nature of society – that is, of patterned human social association in general and of the conditions that make this association possible and define its typical character. Social theory, in this sense, can be defined broadly as theory seeking to explain systematically the structure and organization of society and the general conditions of social order or stability and of social change. Since law as a system of ideas can also be thought of as purporting to specify, reflect and systematize fundamental normative structures of society, it has appeared as both a focus of interest for social theory and, in some sense, a source of competition with social theory in explaining the character of social existence.

The relation of legal thought to social theory is, thus, in important respects, a confrontation between competing general modes of understanding social relationships and the conditions of social order. In one sense, this confrontation is as old as philosophy itself. But as an element in modern philosophical consciousness it represents a gradual working-out in Western thought, over the past two centuries, of the implications of various 'scientific' modes of interpreting social experience, all in one way or another the legacy of Enlightenment ideas.

From the late eighteenth century and throughout the nineteenth century, criteria of 'scientific' rationality were carried into the interpretation of social phenomena through the development of social theory. These criteria also significantly influenced the development of modern legal thought. The classic social theory of the late nineteenth and early twentieth centuries, which established an enduring vocabulary of concepts for the interpretation of social phenomena, treated law as an object of social inquiry within its scope. It sought scientific understanding of the nature of legal phenomena in terms of broad systems of explanation of the general nature of social relationships, structures and institutions.

In the late twentieth century the relationship between social theory and law has been marked by fundamental changes both in the outlook of social theory and in forms of contemporary regulation. On the one hand, social theory has been subjected to wide-ranging challenges to its modern scientific pretensions. It has had to respond to scepticism about claims that social life can usefully be analysed in terms of historical laws, or authoritatively interpreted and explained in terms of founding theoretical principles. On the other hand, the inexorable expansion of Western law's regulatory scope and detail appears, sociologically, as largely uncontrollable by moral systems and relatively unguided by philosophical principles. Hence, in some postmodern interpretations, contemporary law is presented as a system of knowledge and

interpretation of social life of great importance, yet one that has ultimately evaded the Enlightenment ambition systematically to impose reason and principle – codified by theory – on agencies of political and social power.

SOCIALISM

While socialist ideas may retrospectively be identified in many earlier forms of protest and rebellion against economic injustice and political oppression, socialism both as a relatively coherent theoretical doctrine and as an organized political movement had its origins in early nineteenth-century Europe, especially in Britain, France and Germany. It was, above all, a critical response to early industrial capitalism, to an unregulated market economy in which the means of production were privately owned and propertyless workers were forced to sell their labour power to capitalists for often meagre wages. The evils of this system seemed manifest to its socialist critics. Not only was the relationship between workers and capitalists inherently exploitative, and the commodification of labour an affront to human dignity, but it generated widespread poverty and recurrent unemployment, massive and unjust inequalities of wealth and economic power, degrading and soul-destroying work, and an increasingly atomized and individualistic society.

Socialists were not alone in criticizing some of these features of industrial capitalism and its accompanying ideology of economic liberalism. In particular, antipathy towards individualism was also a characteristic of conservative thought. But whereas conservatives found their inspiration in the hierarchically structured organic communities of the past, and were deeply hostile to the political radicalism of the French Revolution, socialists looked forward to new forms of community consistent with the ideals of liberty, equality and fraternity. For them, the evils of capitalism could be overcome only by replacing private with public or common ownership of the means of production, abolishing wage labour and creating a classless society where production geared to capitalist profits gave way to socially organized production for the satisfaction of human needs. In such a society, the human potential for a genuinely 'social' mode of existence would be realized, with mutual concern for others' wellbeing rather than unbridled pursuit of self-interest, with cooperation for common ends rather than competition for individual ones, and with generosity and sharing rather than greed and acquisitiveness – a truly human community.

For most nineteenth-century socialist theorists, the historic task of creating such a society was assigned to the organized industrial working class; most notably by Marx, the pre-eminent figure in the history of socialism. It was Marx who (along with Engels) provided the socialist movement not only with a theoretically sophisticated economic analysis of capitalism and a biting critique of its social consequences, but also, through his scientific, materialist theory of historical development, with the confident belief that the inherent contradictions and class antagonisms of capitalism would eventually give birth to a socialist society.

In marked contrast to such earlier optimism, contemporary socialists are faced with the continued resilience of capitalist societies and the collapse of at least nominally socialist regimes in the USSR and elsewhere, regimes in which state ownership and centralized planning have been accompanied by political repression and economic failure. For those who reject the idea that a suitably regulated form of welfare capitalism is the most that can be hoped for, the task is to construct some alternative model of a socialist economy which is preferable to this yet which avoids the evils of centralized state socialism.

SOCIETY, CONCEPT OF

The term 'society' is broader than 'human society'. Many other species are described as possessing a social way of life. Yet mere gregariousness, of the kind found in a herd of cattle or a shoal of fish, is not enough to constitute a society. For the biologist, the marks of the social are cooperation (extending beyond cooperation between parents in raising young) and some form of order or division of labour. In assessing the merits of attempts to provide a more precise definition of society, we can ask whether the definition succeeds in capturing our intuitive understanding of the term, and also whether it succeeds in identifying those features of society which are most fundamental from an explanatory point of view – whether it captures the Lockean 'real essence' of society.

One influential approach seeks to capture the idea of society by characterizing social action, or interaction, in terms of the particular kinds of awareness it involves. Another approach focuses on social order, seeing it as a form of order that arises spontaneously when rational and mutually aware

individuals succeed in solving coordination problems. Yet another approach focuses on the role played by communication in achieving collective agreement on the way the world is to be classified and understood, as a precondition of coordination and cooperation.

SOCINIANISM

Socinianism was both the name for a sixteenth- and seventeenth-century theological movement which was a forerunner of modern unitarianism, and, much less precisely, a polemic term of abuse suggesting positions in common with that 'heretical' movement. Socinianism was explicitly undogmatic but centred on disbelief in the Trinity, original sin, the satisfaction, and the natural immortality of the soul. Some Socinians were materialists. Socinians focused on moralism and Christ's prophetic role; the elevation of reason in interpreting Scripture against creeds, traditions and church authority; and support for religious toleration. The term was used polemically against many theorists, including Hugo Grotius, William Chillingworth, the Latitudinarians, and John Locke, who emphasized free will, moralism, the role and capacity of reason, and that Christianity included only a very few fundamental doctrines necessary for salvation.

SOCIOBIOLOGY

Following Darwin, biologists and social scientists have periodically been drawn to the theory of natural selection as the source of explanatory insights about human behaviour and social institutions. The combination of Mendelian genetics and Darwinian theory, which did so much to substantiate the theory of evolution in the life sciences, however, has made recurrent adoption of a biological approach to the social sciences controversial. Excesses and errors in social Darwinism, eugenics and mental testing have repeatedly exposed evolutionary approaches in the human sciences to criticism.

Sociobiology is the version of Darwinism in social and behavioural science that became prominent in the last quarter of the twentieth century. Philosophical problems of sociobiology include challenges to the explanatory relevance of Darwinian theory for human behaviour and social institutions, controversies about whether natural selection operates at levels of organization above or below the individual, questions about the meaning of the nature–nurture distinction, and disputes about Darwinism's implications for moral philosophy.

SOCIOLOGY OF KNOWLEDGE

Sociologists of knowledge contribute to the enterprise of generating a naturalistic account of knowledge by describing and explaining the observed characteristics of shared cultures. They assume that knowledge can be treated as an object of empirical investigation (rather than mere celebration or condemnation). Because science is understandably taken as our best example of knowledge, the sociology of scientific knowledge plays a pivotal role in the field. It is argued that our natural reasoning capacities, and our sense experience, are necessary but not sufficient conditions for scientific knowledge. Sociologists looking for the causes of its content and style focus on the contribution of conventions and institutions.

DAVID BLOOR

SOCRATES (469–399 BC)

Introduction

Socrates, an Athenian Greek of the second half of the fifth century BC, wrote no philosophical works but was uniquely influential in the later history of philosophy. His philosophical interests were restricted to ethics and the conduct of life, topics which thereafter became central to philosophy. He discussed these in public places in Athens, sometimes with other prominent intellectuals or political leaders, sometimes with young men, who gathered round him in large numbers, and other admirers. Among these young men was Plato. Socrates' philosophical ideas and – equally important for his philosophical influence – his personality and methods as a 'teacher' were handed on to posterity in the 'dialogues' that several of his friends wrote after his death and which depicted such discussions. Only those of Xenophon (*Memorabilia*, *Apology*, *Symposium*) and the early dialogues of Plato survive

(for example *Euthyphro*, *Apology*, *Crito*). Later Platonic dialogues such as *Phaedo*, *Symposium* and *Republic* do not present the historical Socrates' ideas; the 'Socrates' appearing in them is a spokesman for Plato's own ideas.

Socrates' discussions took the form of face-to-face interrogations of another person. Most often they concerned the nature of some moral virtue, such as courage or justice. Socrates asked what the respondent thought these qualities of mind and character amounted to, what their value was, how they were acquired. He would then test their ideas for logical consistency with other highly plausible general views about morality and goodness that the respondent also agreed to accept, once Socrates presented them. He succeeded in showing, to his satisfaction and that of the respondent and any bystanders, that the respondent's ideas were not consistent. By this practice of 'elenchus' or refutation he was able to prove that politicians and others who claimed to have 'wisdom' about human affairs in fact lacked it, and to draw attention to at least apparent errors in their thinking. He wanted to encourage them and others to think harder and to improve their ideas about the virtues and about how to conduct a good human life. He never argued directly for ideas of his own, but always questioned those of others. None the less, one can infer, from the questions he asks and his attitudes to the answers he receives, something about his own views.

Socrates was convinced that our souls – where virtues and vices are found – are vastly more important for our lives than our bodies or external circumstances. The quality of our souls determines the character of our lives, for better or for worse, much more than whether we are healthy or sick, or rich or poor. If we are to live well and happily, as he assumed we all want to do more than we want anything else, we must place the highest priority on the care of our souls. That means we must above all want to acquire the virtues, since they perfect our souls and enable them to direct our lives for the better. If only we could know what each of the virtues is we could then make an effort to obtain them. As to the nature of the virtues, Socrates seems to have held quite strict and, from the popular point of view, paradoxical views. Each virtue consists entirely in knowledge, of how it is best to act in some area of life, and why: additional 'emotional' aspects, such as the disciplining of our feelings and desires, he dismissed as of no importance. Weakness of will is not psychologically possible: if you act wrongly or badly, that is due to your ignorance of how you ought to act and why. He thought each of the apparently separate virtues amounts to the same single body of knowledge: the comprehensive knowledge of what is and is not good for a human being. Thus his quest was to acquire this single wisdom: all the particular virtues would follow automatically.

At the age of 70 Socrates was charged before an Athenian popular court with 'impiety' – with not believing in the Olympian gods and corrupting young men through his constant questioning of everything. He was found guilty and condemned to death. Plato's *Apology*, where Socrates gives a passionate defence of his life and philosophy, is one of the classics of Western literature. For different groups of later Greek philosophers he was the model both of a sceptical inquirer who never claims to know the truth, and of a 'sage' who knows the whole truth about human life and the human good. Among modern philosophers, the interpretations of his innermost meaning given by Montaigne, Hegel, Kierkegaard, and Nietzsche are especially notable.

1 Life and sources

Socrates, an Athenian citizen proud of his devotion to Athens, lived his adult life there engaging in open philosophical discussion and debate on fundamental questions of ethics, politics, religion and education. Going against the grain of the traditional education, he insisted that personal investigation and reasoned argument, rather than ancestral custom, or appeal to the authority of Homer, Hesiod and other respected poets, was the only proper basis for answering these questions. His emphasis on argument and logic and his opposition to unquestioning acceptance of tradition allied him with such Sophists of a generation earlier as Protagoras, Gorgias and Prodicus, none of whom was an Athenian, but all of whom spent time lecturing and teaching at Athens (see Sophists). Unlike these Sophists Socrates did not formally offer himself or accept pay as a teacher. But many upper-class young Athenian men gathered round him to hear and engage in his discussions, and he had an inspirational and educational effect upon them, heightening their powers of critical thought and encouraging them to take seriously their individual responsibility to think through and decide how to conduct their lives. Many of his contemporaries perceived this education as morally and socially destructive – it certainly

involved subverting accepted beliefs – and he was tried in 399 BC before an Athenian popular court and condemned to death on a charge of 'impiety': that he did not believe in the Olympian gods, but in new ones instead, and corrupted the young. Scholars sometimes mention specifically political motives of revenge, based on guilt by association: a number of prominent Athenians who were with Socrates as young men or were close friends did turn against the Athenian democracy and collaborated with the Spartans in their victory over Athens in the Peloponnesian war. But an amnesty passed by the restored democracy in 403 BC prohibited prosecution for political offences before that date. The rhetorician Polycrates included Socrates' responsibility for these political crimes in his *Accusation of Socrates* (see Xenophon, *Memorabilia* I 2.12), a rhetorical exercise written at least five years after Socrates' death. But there is no evidence that, in contravention of the amnesty, Socrates' actual accusers covertly attacked him, or his jurors condemned him, on that ground. The defences PLATO and Xenophon constructed for Socrates, each in his respective *Apology*, imply that it was his own questioning mind and what was perceived as the bad moral influence he had on his young men that led to his trial and condemnation.

Socrates left no philosophical works, and apparently wrote none. His philosophy and personality were made known to later generations through the dialogues that several of his associates wrote with him as principal speaker. Only fragments survive of those by Aeschines of Sphettus and Antisthenes, both Athenians, and Phaedo of Elis (after whom Plato's dialogue *Phaedo* is named). Our own knowledge of Socrates depends primarily on the dialogues of Plato and the Socratic works of the military leader and historian Xenophon. Plato was a young associate of Socrates' during perhaps the last ten years of his life, and Xenophon knew him during that same period, though he was absent from Athens at the time of Socrates' death and for several years before and many years after.

We also have secondary evidence from the comic playwright Aristophanes and from Aristotle. Aristotle, although born fifteen years after Socrates' death, had access through Plato and others to first-hand information about the man and his philosophy. Aristophanes knew Socrates personally; his *Clouds* (first produced *c.*423 BC) pillories the 'new' education offered by Sophists and philosophers by showing Socrates at work in a 'thinkery', propounding outlandish physical theories and teaching young men how to argue cleverly in defence of their improper behaviour. It is significant that in 423, when Socrates was about 45 years old, he could plausibly be taken as a leading representative in Athens of the 'new' education. But one cannot expect a comic play making fun of a whole intellectual movement to contain an authentic account of Socrates' specific philosophical commitments.

However, the literary genre to which Plato's and Xenophon's Socratic works belong (along with the other, lost dialogues) also permits the author much latitude; in his *Poetics* Aristotle counts such works as fictions of a certain kind, alongside epic poems and tragedies. They are by no means records of actual discussions (despite the fact that Xenophon explicitly so represents his). Each author was free to develop his own ideas behind the mask of Socrates, at least within the limits of what his personal experience had led him to believe was Socrates' basic philosophical and moral outlook. Especially in view of the many inconsistencies between Plato's and Xenophon's portraits (see §7 later), it is a difficult question for historical-philosophical interpretation whether the philosophical and moral views the character Socrates puts forward in any of these dialogues can legitimately be attributed to the historical philosopher. The problem of interpretation is made more difficult by the fact that Socrates appears in many of Plato's dialogues – ones belonging to his middle and later periods (see PLATO §§10–16) – discussing and expounding views that we have good reason to believe resulted from Plato's own philosophical investigations into questions of metaphysics and epistemology, questions that were not entered into at all by the historical Socrates. To resolve this problem – what scholars call the 'Socratic problem' – most now agree in preferring Plato to Xenophon as a witness. Xenophon is not thought to have been philosopher enough to have understood Socrates well or to have captured the depth of his views and his personality. As for Plato, most scholars accept only the philosophical interests and procedures, and the moral and philosophical views, of the Socrates of the early dialogues, and, more guardedly, the Socrates of 'transitional' ones such as *Meno* and *Gorgias*, as legitimate representations of the historical personage. These dialogues are the ones that predate the emergence of the metaphysical and epistemological inquiries just referred to. However, even Plato's early dialogues are philosophical works written to further Plato's own philosophical interests. That could produce distortions, also; and Xenophon's relative philosophical innocence could make his portrait in some respects more reliable. Moreover, it is possible, even probable, that in his efforts to help his young men improve themselves Socrates spoke differently to the philosophically more promising ones among them – including Plato – from the way he spoke to others, for example Xenophon. Both portraits could be true, but partial and needing to be

combined (see §7). The account of Socrates' philosophy given below follows Plato, with caution, while giving independent weight also to Xenophon and to Aristotle.

2 Life and sources (cont.)

Xenophon's *Apology* of Socrates, *Symposium* and *Memorabilia* (or *Memoirs*) may well reflect knowledge of Plato's own *Apology* and some of his early and middle period dialogues, as well as lost dialogues of Antisthenes and others. Xenophon composed the *Memorabilia* over many years, beginning only some ten years after Socrates' death, avowedly in order to defend Socrates' reputation as a good man, a true Athenian gentleman, and a good influence upon his young men. The same intention motivated his *Apology* and *Symposium*. Anything these works contain about Socrates' philosophical opinions and procedures is ancillary to that apologetic purpose. Plato's *Apology*, of course, is similarly apologetic, but it and his other early dialogues are carefully constructed discussions, strongly focused upon questions of philosophical substance. Plato evidently thought Socrates' philosophical ideas and methods were central to his life and to his mission. Xenophon's and Plato's testimony agree that Socrates' discussions consistently concerned the *aretai*, the recognized 'virtues' or excellences of character (see Aretē), such as justice, piety, self-control or moderation (*sōphrosynē*), courage and wisdom; what these individual characteristics consist in and require of a person, what their value is, and how they are acquired, whether by teaching or in some other way. In his *Apology* and elsewhere Plato has Socrates insist that these discussions were always inquiries, efforts made to engage his fellow-discussants in coming jointly to an adequate understanding of the matters inquired into. He does not himself know, and therefore cannot teach anyone else – whether by means of these discussions or in some other way – either how to be virtuous or what virtue in general or any particular virtue is. Furthermore, given his general characterization of virtue (see §§4–5), Plato's Socrates makes a point of suggesting the impossibility in principle of teaching virtue at all, by contrast with the Sophists who declared they could teach it. Virtue was not a matter of information about living or rote techniques of some sort to be handed on from teacher to pupil, but required an open-ended personal understanding that individuals could only come to for themselves. Xenophon, too, reports that Socrates denied he was a teacher of *aretē*, but he pays no attention to such issues of philosophical principle. He does not hesitate to show Socrates speaking of himself as a teacher (see *Apology* 26, *Memorabilia* I 6.13–14), and describes him as accepting young men from their fathers as his pupils (but not for a fee), and teaching them the virtues by displaying his own virtues to them for emulation, as well as through conversation and precepts. Perhaps Socrates did not insist on holding to strict philosophical principles in dealing with people on whom their point would have been lost.

In his *Apology* Plato's Socrates traces his practice of spending his days discussing and inquiring about virtue to an oracle delivered at the shrine of Apollo at Delphi. Xenophon also mentions this oracle in his *Apology*. A friend of Socrates', Chaerephon, had asked the god whether anyone was wiser than Socrates; the priestess answered that no one was. Because he was sure he was not wise at all – only the gods, he suspected, could actually *know* how a human life ought to be led – Socrates cross-examined others at Athens with reputations for that kind of wisdom. He wanted to show that there were people wiser than he and thus discover the true meaning of the oracle – Apollo was known to speak in riddles requiring interpretation to reach their deeper meaning. In the event, it turned out that the people he examined were not wise, since they could not even give a self-consistent set of answers to his questions: obviously, true knowledge requires at least that one think and speak consistently on the subjects one professes to know. So he concluded that the priestess's reply had meant that of all those with reputations for wisdom only he came close to deserving it; he wisely did not profess to know these things that only gods can know, and that was wisdom enough for a human being. Because only he knew that he did *not* know, only he was ready earnestly to inquire into virtue and the other ingredients of the human good, in an effort to learn. He understood therefore that Apollo's true intention in the oracle had been to encourage him to continue his inquiries, to help others to realize that it is beyond human powers actually to *know* how to live – that is the prerogative of the gods – and to do his best to understand as far as a human being can how one ought to live. The life of philosophy, as led by him, was therefore something he was effectively ordered by Apollo to undertake.

We must remember that Socrates was on trial on a charge of 'impiety'. In tracing his philosophical vocation back to Apollo's oracle, and linking it to a humble recognition of human weakness and divine perfection, he was constructing a powerful rebuttal of the charges brought against him. But it cannot be literally true – if that is what he intended to say – that Socrates began his inquiries about virtue only after hearing of the oracle. Chaerephon's question to Apollo shows Socrates had established a reputation in Athens for wisdom before that. That reputation cannot have rested on philosophical

inquiries of another sort. In Plato's *Phaedo* Socrates says he had been interested as a young man in philosophical speculations about the structure and causes of the natural world, but he plainly did not take those interests very far; and in any event, his reputation was not for that kind of wisdom, but wisdom about how to lead a human life. In fact we do not hear of the duty to Apollo in Xenophon, or in other dialogues of Plato, where we might expect to find it if from the beginning Socrates thought Apollo had commanded his life of philosophizing. However, we need not think Socrates was false to the essential spirit of philosophy as he practised it if in looking back on his life under threat of condemnation for impiety he chose, inaccurately, to see it as initially imposed on him by Apollo's oracle.

Despite its impressiveness, Socrates' speech failed to convince his jury of 501 male fellow citizens, and he died in the state prison by drinking hemlock as required by law. His speech evidently offended the majority of the jurors by its disdain for the charges and the proceedings; Xenophon explains his lofty behaviour, which he thinks would otherwise have been lunatic – and damaging to his reputation – by reporting that he had told friends in advance that as a 70-year-old still in possession of his health and faculties it was time for him to die anyhow, before senility set in. Furthermore, his 'divine sign' – the 'voice' he sometimes heard warning him for his own good against a contemplated course of action – had prevented him from spending time crafting a defence speech. (This voice seems to have been the basis for the charge of introducing 'new' gods.) So he would do nothing to soften his manner in order to win his freedom. Even if this story is true, Plato could be right that Socrates put on a spirited, deeply serious defence of his life and beliefs – one that he thought should have convinced the jurors of his innocence, if only they had judged him intelligently and fairly.

3 Socratic elenchus, or refutation

In cross-examining those with reputations for wisdom about human affairs and showing their lack of it, Socrates employed a special method of dialectical argument that he himself had perfected, the method of 'elenchus' – Greek for 'putting to the test' or 'refutation'. He gives an example at his trial when he cross-examines Meletus, one of his accusers (Plato, *Apology* 24d–27e). The respondent states a thesis, as something he *knows* to be true because he is wise about the matter in question. Socrates then asks questions, eliciting clarifications, qualifications and extensions of the thesis, and seeking further opinions of the respondent on related matters. He then argues, and the respondent sees no way not to grant, that the original thesis is logically inconsistent with something affirmed in these further responses. For Socrates, it follows at once that the respondent did not know what he was talking about in stating his original thesis: true knowledge would prevent one from such self-contradiction. So the respondent suffers a personal set-back; *he* is refuted – revealed as incompetent. Meletus, for example, does not have consistent ideas about the gods or what would show someone not to believe in them, and he does not have consistent ideas about who corrupts the young, and how; so he does not know what he is talking about, and no one should take *his* word for it that Socrates disbelieves in the gods or has corrupted his young men. In many of his early dialogues Plato shows Socrates using this method to examine the opinions of persons who claim to be wise in some matter: the religious expert Euthyphro on piety (*Euthyphro*), the generals Laches and Nicias on courage (*Laches*), the Sophist Protagoras on the distinctions among the virtues and whether virtue can be taught (*Protagoras*), the rhapsodist Ion on what is involved in knowing poetry (*Ion*), the budding politician Alcibiades on justice and other political values (*Alcibiades*), the Sophist Hippias on which was the better man, Odysseus or Achilles (*Lesser Hippias*), and on the nature of moral and aesthetic beauty (*Greater Hippias*). They are all refuted – shown to have mutually inconsistent ideas on the subject discussed (see PLATO §§4, 6, 8–9).

But Socrates is not content merely to demonstrate his interlocutor's lack of wisdom or knowledge. That might humiliate him into inquiring further or seeking by some other means the knowledge he has been shown to lack, instead of remaining puffed up with self-conceit. That would be a good thing. But Socrates often also indicates clearly that his cross-examination justifies him and the interlocutor in rejecting as false the interlocutor's original thesis. Logically, that is obviously wrong: if the interlocutor contradicts himself, at least one of the things he has said must be false (indeed, all of them could be), but the fact alone of self-contradiction does not show where the falsehood resides. For example, when Socrates leads Euthyphro to accept ideas that contradict his own definition of the pious as whatever pleases all the gods, Socrates concludes that that definition has been shown to be false (*Euthyphro* 10d–11a), and asks Euthyphro to come up with another one. He does not usually consider that perhaps on further thought the additional ideas would seem faulty and so merit rejection instead – thus leaving room to retain the definition.

Socrates uses his elenctic method also in discussion with persons who are not puffed up with false

pride, and are quite willing to admit their ignorance and to reason out the truth about these important matters. Examples are his discussions with his longtime friend Crito on whether he should escape prison and set aside the court's death sentence (Plato, *Crito*), and with the young men Charmides, on self-control (*Charmides*), and Lysis and Menexenus, on the nature of friendship (*Lysis*). Socrates examines Crito's proposal that he escape on the basis of principles that he presents to him for his approval, and he, together with Crito (however half-heartedly), rejects it when it fails to be consistent with them. And he examines the young men's successive ideas about these virtues, rejecting some of them and refining others, by relying on their own acceptance of further ideas that he puts to them. Again, he is confident that the inconsistencies brought to light in their ideas indicate the inadequacy of their successive proposals as to the nature of the moral virtue in question.

In many of his discussions, both with young men and the allegedly wise, Socrates seeks to know what some morally valuable property is – for example, piety, courage, self-control or friendship (see §4). Rejecting the idea that one could learn this simply from attending to examples, he insisted on an articulated 'definition' of the item in question – some *single* account that would capture all at once the presumed common feature that would entitle anything to count as a legitimate instance. Such a definition, providing the essence of the thing defined, would give us a 'model' or 'paradigm' to use in judging whether or not some proposed action or person possesses the moral value so defined (*Euthyphro* 6d–e). Aristotle says (in *Metaphysics* I, 6) that Socrates was the first to interest himself in such 'universal definitions', and traces to his interest in them Plato's first impetus towards a theory of Forms, or 'separated' universals (see Plato §10).

In none of his discussions in Plato's early works does Socrates profess to think an adequate final result has actually been established – about the nature of friendship, or self-control, or piety, or any of the other matters he inquires about. Indeed, on the contrary, these works regularly end with professions of profound ignorance about the matter under investigation. Knowledge is never attained, and further questions always remain to be considered. But Socrates does plainly think that progress towards reaching final understanding has taken place (even if only a god, and no human being, could ever actually attain it). Not only has one discovered some things that are definitely wrong to say; one has also achieved some positive insights that are worth holding onto in seeking further systematic understanding. Given that Socrates' method of discussion is elenctic throughout, what does he think justifies this optimism?

On balance, our evidence suggests that Socrates had worked out no elaborate theory to support him here. The ideas he was stimulated to propound in an elenctic examination which went against some initial thesis seemed to him, and usually also to the others present, so plausible, and so supportable by further considerations, that he and they felt content to reject the initial thesis. Until someone came up with arguments to neutralize their force, it seemed the thesis was doomed, as contrary to reason itself. Occasionally Socrates expresses himself in just those terms: however unpalatable the option might seem, it remains open to someone to challenge the grounds on which his conclusions rest (see *Euthyphro* 15c, *Gorgias* 461d–462a, 509a, *Crito* 54d). But until they do, he is satisfied to treat his and his interlocutor's agreement as a firm basis for thought and action. Later, when Plato himself became interested in questions of philosophical methodology in his *Meno*, this came to seem a philosophically unsatisfactory position; Plato's demand for justification for one's beliefs independent of what seemed on reflection most plausible led him to epistemological and metaphysical inquiries that went well beyond the self-imposed restriction of Socratic philosophy to ethical thought in the broadest sense. But Socrates did not raise these questions. In this respect more bound by traditional views than Plato, he had great implicit confidence in his and his interlocutors' capacity, after disciplined dialectical examination of the issues, to reach firm ground for constructing positive ideas about the virtues and about how best to lead a human life – even if these ideas never received the sort of final validation that a god, understanding fully the truth about human life, could give them.

4 Elenchus and moral progress

The topics Socrates discussed were always ethical, and never included questions of physical theory or metaphysics or other branches of philosophical study. Moreover, he always conducted his discussions not as theoretical inquiries but as profoundly personal moral tests. Questioner and interlocutor were equally putting their ways of life to what Socrates thought was the most important test of all – their capacity to stand up to scrutiny in rational argument about how one ought to live. In speaking about human life, he wanted his respondents to indicate what they truly believed, and as questioner he was prepared to do the same, at least at crucial junctures. Those beliefs were assumed to express not theoretical ideas, but the very ones on which they themselves were conducting their lives. In

losing an argument with Socrates you did not merely show yourself logically or argumentatively deficient, but also put into question the very basis on which you were living. Your way of life might ultimately prove defensible, but if you cannot now defend it successfully, you are not leading it *with* any such justification. In that case, according to Socrates' views, your way of life is morally deficient. Thus if Menexenus, Lysis and Socrates profess to value friendship among the most important things in life and profess to be one another's friends, but cannot satisfactorily explain under pressure of elenctic investigation what a friend is, that casts serious doubt on the quality of any 'friendship' they might form (Plato, *Lysis* 212a, 223b). Moral consistency and personal integrity, and not mere delight in argument and logical thought, should therefore lead you to repeated elenctic examination of your views, in an effort to render them coherent and at the same time defensible on all sides through appeal to plausible arguments. Or, if some of your views have been shown false, by conflicting with extremely plausible general principles, it behoves you to drop them – and so to cease living in a way that depends upon accepting them. In this way, philosophical inquiry via the elenchus is fundamentally a personal moral quest. It is a quest not just to understand adequately the basis on which one is actually living, and the personal and moral commitments that this contains. It is also a quest to change the way one lives as the results of argument show one ought to, so that, at the logical limit of inquiry, one's way of life would be completely vindicated. Accordingly, Socrates in Plato's dialogues regularly insists on the individual and personal character of his discussions. He wants to hear the views of the one person with whom he is speaking. He dismisses as of no interest what outsiders or most people may think – provided that is not what his discussant is personally convinced is true. The views of 'the many' may well not rest on thought or argument at all. Socrates insists that his discussant shoulder the responsibility to explain and defend rationally the views he holds, and follow the argument – reason – wherever it may lead.

We learn a good deal about Socrates' own principles from both Plato and Xenophon. Those were ones that had stood up well over a lifetime of frequent elenctic discussions and had, as he thought, a wealth of plausible arguments in their favour. Foremost is his conviction that the virtues – self-control, courage, justice, piety, wisdom and related qualities of mind and soul – are essential if anyone is to lead a good and happy life. They are good in themselves for a human being, and they guarantee a happy life, *eudaimonia* – something that he thought all human beings always wanted, and wanted more than anything else. The virtues belong to the soul – they are the condition of a soul that has been properly cared for and brought to its best state. The soul is vastly more important for happiness than are health and strength of the body or social and political power, wealth and other external circumstances of life; the goods of the soul, and pre-eminently the virtues, are worth far more than any quantity of bodily or external goods. Socrates seems to have thought these other goods *are* truly good, but they only *do* people good, and thereby contribute to their happiness, under the condition that they are chosen and used in accordance with virtues indwelling in their souls (see Plato, *Apology* 30b, *Euthydemus* 280d–282d, *Meno* 87d–89a).

More specific principles followed. Doing injustice is worse for oneself than being subjected to it (*Gorgias* 469c–522e): by acting unjustly you make your soul worse, and that affects for the worse the whole of your life, whereas one who treats you unjustly at most harms your body or your possessions but leaves your soul unaffected. On the same ground Socrates firmly rejected the deeply entrenched Greek precept to aid one's friends and harm one's enemies, and the accompanying principle of retaliation, which he equated with returning wrongs for wrongs done to oneself and one's friends (*Crito* 49a–d). Socrates' daily life gave witness to his principles. He was poor, shabbily dressed and unshod, and made do with whatever ordinary food came his way: such things matter little. Wealth, finery and delicacies for the palate are not worth panting after and exerting oneself to enjoy. However, Socrates was fully capable of relishing both refined and plain enjoyments as occasion warranted (see §7).

5 The unity of virtue

The Greeks recognized a series of specially prized qualities of mind and character as *aretai* or virtues. Each was regarded as a distinct, separate quality: justice was one thing, concerned with treating other people fairly, courage quite another, showing itself in vigorous, correct behaviour in circumstances that normally cause people to be afraid; and self-control or moderation, piety and wisdom were yet others. Each of these ensured that its possessor would act in some specific ways, regularly and reliably over their lifetime, having the justified conviction that those are ways one *ought* to act – *agathon* (good) and *kalon* (fine, noble, admirable or beautiful) ways of acting. But each type of virtuous person acts rightly and well not only in regularly recurring, but also in unusual and unheralded, circumstances; the virtue involves always getting something right about how to live a good human life. Socrates thought these

virtues were essential if one was to live happily (see §4). But what exactly were they? What was it about someone that made them just, or courageous, or wise? If you did not know that, you would not know what to do in order to acquire those qualities. Furthermore, supposing you did possess a virtue, you would have to be able to explain and defend by argument the consequent ways in which you lived – otherwise your conviction that those are ways one *ought* to act would be shallow and unjustified. And in order to do that you would have to know what state of mind the virtue was, since that is essential to them (see Plato, *Charmides* 158e–159a). Consequently, in his discussions Socrates constantly asked for 'definitions' of various virtues: what is courage (*Laches*), what is self-control or moderation (*Charmides*), what is friendship (*Lysis*) and what is piety (*Euthyphro*). As this context shows, he was asking not for a 'dictionary definition', an account of the accepted linguistic understanding of a term, but for an ethically defensible account of an actual condition of mind or character to which the word in common use would be correctly applied. In later terminology, he was seeking a 'real' rather than a 'nominal' definition (see DEFINITION; PLATO §§6–9).

Socrates objected to definitions that make a virtue some external aspect of a virtuous action (such as the manner in which it is done – for example its 'quiet' or measured quality in the case of moderation; *Charmides* 160b–d), or simply the doing of specific types of action, described in terms of their external circumstances (such as, for courage, standing one's ground in battle; *Laches* 190e–191d). He also objected to more psychological definitions that located a virtue in some non-rational and non-cognitive aspect of the soul (for example, in the case of courage, the soul's endurance or strength of resistance; *Laches* 192d–193e). For his own part, he regularly shows himself ready to accept only definitions that identify a virtue with some sort of knowledge or wisdom about what is valuable for a human being. That 'intellectualist' expectation about the nature of virtue, although never worked out to his satisfaction in any Platonic dialogue, is central to Socrates' philosophy.

Given that in his discussions he is always the questioner, probing the opinions of his respondent and not arguing for views of his own, we never find Socrates stating clearly what led him to this intellectualism. Probably, however, it was considerations drawn from the generally agreed premise that each virtue is a condition motivating certain voluntary actions, chosen because they are good and fine or noble. He took it that what lies behind and produces any voluntary action is the idea under which it is done, the conception of the action in the agent's mind that makes it seem the thing to do just then. If so, each virtue must be some state of the mind, the possessor of which constantly has certain distinctive general ideas about how one ought to behave. Furthermore, since virtues get this *right*, these are true ideas. And since a virtuous person acts well and correctly in a *perfectly reliable* way, they must be seated so deeply in the mind as to be ineradicable and unwaveringly present. The only state of mind that meets these conditions is knowledge: to know a subject is not just to be thoroughly convinced, but to have a deep, fully articulated understanding, being ready with explanations to fend off objections and apparent difficulties and to extend old principles into new situations, and being prepared to show with the full weight of reason precisely why each thing falling under it is and must be so. Each virtue, then, must be knowledge about how one ought to behave in some area of life, and why – a knowledge so deep and rationally secure that those who have it can be counted upon never to change their minds, never to be argued out of or otherwise persuaded away from, or to waver in, their conviction about how to act.

In Plato's *Protagoras* Socrates goes beyond this, and identifies himself with the position, rejected by Protagoras in their discussion, that the apparently separate virtues of justice, piety, self-control, courage and wisdom are somehow one and the same thing – some single knowledge (361a–b). Xenophon too confirms that Socrates held this view (*Memorabilia* III 9.5). Protagoras defends the position that each of the virtues is not only a distinct thing from each of the others, but so different in kind that a person could possess one of them without possessing the others (329d–e). In opposing him, Socrates sometimes speaks plainly of two allegedly distinct virtues being 'one' (333b). Given this unity of the virtues, it would follow that a person could not possess one without having them all. And in speaking of justice and piety in particular, Socrates seems to go further, to imply that every action produced by virtue is equally an instance of *all* the standardly recognized virtues: pious as well as just, wise and self-controlled and courageous also. Among his early dialogues, however, Plato's own philosophical interests show themselves particularly heavily in the *Protagoras*, so it is doubtful how far the details of his arguments are to be attributed to the historical Socrates. The issues raised by Socrates in the *Protagoras* were, none the less, vigorously pursued by subsequent 'Socratic' philosophers (as Plutarch's report in *On Moral Virtue* 2 demonstrates). And the positions apparently adopted by Plato's Socrates were taken up and ingeniously defended by the Stoic philosopher Chrysippus (see STOICISM). As usual, because of

his questioner's role, it is difficult to work out Socrates' grounds for holding to the unity of virtue; and it is difficult to tell whether, and if so how, he allowed that despite this unity there were some real differences between, say, justice and self-control, or courage and piety. Apparently he thought the same body of knowledge – knowledge of the whole of what is and is not good for human beings, and why it is so or not – must at least underlie the allegedly separate virtues. If you did not have that vast, comprehensive knowledge you could not be in the state of mind which is justice or in that which is courage, and so on; and if you did have it you would necessarily be in those states of mind. It seems doubtful whether Socrates himself progressed beyond that point. Efforts to do that were made by Chrysippus and the other philosophers referred to above. And despite denying that all virtues consist in knowledge, Plato in the *Republic* and Aristotle in *Nicomachean Ethics* VI follow Socrates to the extent of holding, in different ways, that you need to have all the virtues in order to have any one.

6 Weakness of will denied

In Plato's *Protagoras* Socrates also denies the possibility of weakness of will – being 'mastered' by some desire so as to act voluntarily in a way one knows is wrong or bad (see also Xenophon, *Memorabilia* III 9.4, IV 5.6.) All voluntary wrong-doing or bad action is due to ignorance of how one ought to act and why, and to nothing else. This would be easy to understand if Socrates were using 'knowing' quite strictly, to refer to the elevated and demanding sort of knowledge described in §6 (sometimes called 'Socratic knowledge'). Someone could know an action was wrong or bad, with full 'Socratic knowledge', only if they were not just thoroughly convinced, but had a deep, fully articulated understanding, being ready with explanations to fend off objections and apparent difficulties, and prepared to show precisely *why* it was so. That would mean that these ideas were seated so deeply in the mind as to be ineradicable and unwaveringly present. Accordingly, a person with 'Socratic knowledge' could not come to hold even momentarily that the action in question would be the thing to do, and so they could never do it voluntarily.

However, Plato's Socrates goes further. He explains his denial of weak-willed action by saying that a person cannot voluntarily do actions which, in doing them, they even *believe* to be a wrong or bad thing to do (*Protagoras* 358c–e). He gives a much-discussed, elaborate argument to establish this stronger conclusion, starting from assumptions identifying that which is pleasant with that which is good (352a–357e). These assumptions, however, he attributes only to ordinary people, the ones who say they believe in the possibility of weak-willed action; he makes it clear to the careful reader, if not to Protagoras, that his own view is simply that pleasure is a good thing, not 'the' good (351c–e; see 354b–d). Although some scholars have thought otherwise, Socrates himself does not adopt a hedonist analysis of the good in the *Protagoras* or elsewhere either in Plato or Xenophon; indeed, he speaks elsewhere against hedonist views (see Hedonism). The fundamental principle underlying his argument – a principle he thinks ordinary people will accept – is that voluntary action is always 'subjectively' rational, in the sense that an agent who acts to achieve some particular sort of value always acts with the idea that what they are doing achieves *more* of that value than alternatives then thought by them to be available would achieve. If someone performs an overall bad action because of some (lesser) good they think they will get from it, they cannot do it while *believing* it is bad overall. That would mean they thought they could have got *more* good by refraining, and their action would violate the principle just stated. Instead, at the time they acted (despite what they may have thought before or after acting), they believed (wrongly and ignorantly) that the action would be good overall for them to do. Thus ignorance, and only ignorance, is responsible for voluntary error. Weakness of will – knowingly pursuing the worse outcome – is psychologically impossible: 'No one does wrong willingly'.

The details of this argument may not represent explicit commitments of the historical Socrates. None the less, his denial of weakness of will, understood as presented in Plato's *Protagoras*, was the centre of a protracted debate in later times. First Plato himself, in *Republic* IV, then Aristotle in *Nicomachean Ethics* VII, argued against Socrates' conclusion, on the ground that he had overlooked the fact that human beings have other sources of motivation that can produce voluntary actions, besides their ideas about what is good or bad, or right or wrong to do. 'Appetites' and 'spirited desires' exist also, which can lead a person to act in fulfilment of them without having to adopt the idea, in their beliefs about what is best to do, that so acting would be a good thing (see Plato §14; Aristotle §20, 22–3). The Stoics, however, and especially Chrysippus, argued vigorously and ingeniously in defence of Socrates' analysis and against the Platonic-Aristotelian assumption of alternative sources of motivation that produce voluntary action on their own (see Stoicism). In fact, during Hellenistic times it was the Socratic, 'unitary' psychology of action that carried the day; the Platonic-Aristotelian alternative, dominant in the

'common sense' and the philosophy of modern times, was a minority view. The issues Socrates raised about weakness of will continue to be debated today.

7 Socrates' personality

Socrates drew to himself many of the brightest and most prominent people in Athens, securing their fascinated attention and their passionate friendship and support. His effectiveness as a philosopher, and the Socratic 'legend' itself, depended as much on the strength and interest of his personality as on the power of his mind. Plato's and Xenophon's portraits of Socrates as a person differ significantly, however. Plato's Socrates is aloof and often speaks ironically, although also with unusual and deeply held moral convictions; paradoxically, the depth and clarity of his convictions, maintained alongside the firm disclaimer to know what was true, could seem all the stronger testimony to their truth, and made them felt the more strongly as a rebuke to the superficiality of one's own way of living. In Xenophon, Socrates is also sometimes ironical and playful, especially in the *Symposium*, but his conversation is usually direct, even didactic, and often chummy in tone; his attitudes are for the most part conventional though earnest; and there is nothing to unsettle anyone or make them suspect hidden depths. It is much easier to believe that the Socrates of Plato's dialogues could have had such profound effects on the lives of the brightest of his contemporaries than did the character in Xenophon. That is one reason given for trusting Plato's more than Xenophon's portrait of the historical personage. But perhaps Socrates used the more kindly and genial manner and conventional approach depicted by Xenophon to draw out the best in some of his young men and his friends – ones who would have been put off by the Platonic subtleties. The historical Socrates may have been a more complex person than even Plato presents.

Plato and Xenophon both represent Socrates as strongly attracted to good-looking young men in the 'bloom' of their middle to late teens, just the period when they were also coming of age morally and intellectually. In both he speaks of himself as unusually 'erotic' by temperament and constantly 'in love'. But he explains his 'erotic' attachments in terms of his desire to converse with bright and serious young men, to question them about virtue and how best to live a human life, and to draw out what was best in their minds and characters. In Xenophon he describes his love as love for their souls, not their bodies, and he vigorously condemns sexual relations with any young man: using him that way disgraces him and harms him by encouraging a loose attitude as regards physical pleasures (*Symposium* 8). The overheated sexuality of Plato's own accounts (*Symposium* and *Phaedrus*) of *erōs*, sexual love, for a young man's beauty as motivating an adult male to pursue philosophical truth into an eternal realm of Forms (see PLATO §12) is to be distinguished sharply from Socrates' ideas, as we can gather them from Xenophon and from Plato's own early dialogues.

Xenophon emphasizes Socrates' freedom from the strong appetites for food, drink, sex and physical comfort that dominate other people; his *enkrateia* or self-mastery is the first of the virtues that Xenophon claims for him (*Memorabilia* I 2.1). He was notorious for going barefoot even in winter and dressing always in a simple cloak. Socrates' self-mastery was at the centre of Antisthenes' portrayal, and is reflected also in several incidents reported in Plato, such as his serene dismissal of the young Alcibiades' efforts to seduce him sexually (Plato, *Symposium* 217b–219e), or, perhaps when engrossed in a philosophical problem, his standing in the open (during a break in the action while on military service) from morning to night, totally indifferent to everything around him (*Symposium* 220c–d). This 'ascetic' Socrates, especially as presented by Antisthenes – rejecting conventional comforts and conventional behaviour – became an inspiration for the 'Cynics' of later centuries.

8 Socrates in the history of philosophy

Looking back on the early history of philosophy, later philosophers traced to Socrates a major turn in its development. As Cicero puts it: 'Socrates was the first to call philosophy down from the heavens . . . and compel it to ask questions about life and morality' (*Tusculan Disputations* V 10–11). Previously it had been concerned with the origins and nature of the physical world and the explanation of celestial and other natural phenomena. Modern scholarship follows the ancients' lead in referring standardly to philosophers before Socrates collectively as 'Presocratics' (see PRESOCRATIC PHILOSOPHY). This includes DEMOCRITUS, in fact a slightly younger contemporary of Socrates; Cicero's verdict needs adjustment, in that Democritus, independently of Socrates, also investigated questions about ethics and morality. With the sole exception of Epicureanism, which developed separately out of Democritean origins, all the major movements of Greek philosophy after Socrates had roots in his teaching and example. This obviously applies to Plato, whose philosophical development began with a thorough reworking and assimilation of Socratic moral inquiry, and through him to Aristotle and his fellow members of Plato's

Academy, Speusippus and Xenocrates and others, as well as to later Platonists. Among Socrates' inner circle were also Aristippus of Cyrene, who is traditionally thought to have founded the hedonist Cyrenaic school, and Antisthenes, an older rival of Plato's and major teacher in Athens of philosophical dialectic. Both of these figure in Xenophon's *Memorabilia* (Antisthenes also in his *Symposium*), where they are vividly characterized in conversation with Socrates. Another Socratic, Euclides, founded the Megarian school. These 'Socratic schools' developed different themes already prominent in Socrates' own investigations, and competed in the claim to be his true philosophical heirs.

In the third to first centuries BC, both the Stoics and their rivals the Academic sceptics claimed to be carrying forward the Socratic tradition. In both cases this was based upon a reading of Plato's dialogues and perhaps other eye-witness reconstructions of Socrates' philosophy. The Academic Arcesilaus interpreted the Platonic Socrates as a sceptical inquirer, avidly searching but never satisfied that the truth on any disputed question had been finally uncovered. He could point to much about Plato's Socrates in support: his modest but firm denial that he possessed any knowledge, and his constant practice of inquiring into the truth by examining others' opinions on the basis of ideas which they themselves accepted, without formally committing himself to these ideas even when he was the one to first suggest them. Arcesilaus, however, applied his sceptical Socratic dialectic to more than the questions of ethics and human life about which Socrates himself had argued, making it cover the whole range of philosophical topics being investigated in his day. The Stoics read the dialogues (especially the *Euthydemus* and *Protagoras*) quite differently. They found Socrates espousing a complete doctrine of ethics and the psychology of human action. He posed his questions on the basis of this doctrine, leaving the respondent (and the reader) to recover for themselves the philosophical considerations underlying it. They thus emphasized the conceptions of virtue as knowledge, of virtue as unified in wisdom, and of voluntary action as motivated always by an agent's beliefs about what is best to do, that emerged through Socrates' examination of Protagoras (see §§6–7). They thought these constituted a positive, Socratic moral philosophy, and in their own moral theory they set out to revive and strengthen it with systematic arguments and with added metaphysical and physical speculations of their own. Later Stoics regularly referred to Socrates as a genuine wise man or 'sage', perhaps the only one who ever lived. He had brought to final, systematic perfection his knowledge, along Stoic lines, of what is good and bad for human beings, and what is not, and therefore possessed all the virtues and no vices, and lived unwaveringly the best, happy life, free from emotion and all other errors about human life. It is a tribute to the complexity and enigmatic character of Socrates that he could stand simultaneously as a paragon both of sceptical, non-committal inquiry and life led on that uncommitted basis, and of dogmatic knowledge of the final truth about all things human.

The figure of Socrates has continued to fascinate and to inspire ever-new interpretations of his innermost meaning. For MONTAIGNE, he proved that human beings can convincingly and attractively order their own lives from their own resources of mind, without direction from God or religion or tradition. In the nineteenth century KIERKEGAARD and NIETZSCHE offered extensive interpretations of him, both heavily dependent upon Hegel's absolute-idealist analysis. HEGEL interpreted Socrates as a quintessentially negative thinker, aiming at making people vacillate in their superficial moral beliefs and endorse none of them wholeheartedly, thus hinting that the truth, although universal and objective, lies deep within the freedom of their own subjectivity. For Kierkegaard he represents, on the contrary, the possibility of living wholeheartedly by occupying an unarticulated position somehow beyond the negative rejection but expressed through it: 'infinite absolute negativity'. In *Die Geburt der Tragödie* (*The Birth of Tragedy*) Nietzsche treats Socrates principally as having poisoned the 'tragic' attitude that made possible the great achievements of classical culture, by insisting that life should be grounded in rational understanding and justified by 'knowledge'; but his fascinated regard for Socrates led him to return to him repeatedly in his writings. Socrates was paradigmatically a philosopher whose thought, however taken up with logic and abstract argument, is inseparable from the search for self-understanding and from a deeply felt attachment to the concerns of human life. His power to fascinate and inspire is surely not exhausted.

SOLIDARITY

Solidarity exists among a group of people when they are committed to abiding by the outcome of some process of collective decision-making, or to promoting the wellbeing of other members of the group, perhaps at significant cost to themselves. Many regard solidarity as an important political ideal on the grounds that it is related to community and fraternity, and conducive to social cohesion and stability. Some individualists, however, believe that it is incompatible with autonomy on the grounds that full autonomy requires one always to take the final decision oneself about what one should do.

ANDREW MASON

SOLIPSISM

'Solipsism' (from the Latin *solus ipse* – oneself alone) is the doctrine that only oneself exists. This formulation covers two doctrines, each of which has been called solipsism, namely (1) that one is the only self, the only centre of consciousness, and, more radically, (2) that nothing at all exists apart from one's own mind and mental states. These are not always distinguished from corresponding epistemic forms: for all we know, (1) or (2) might be true.

A more recent coinage is 'methodological solipsism', which has a quite different meaning: that the content of an individual's thoughts is fully determined by facts about them, and is independent of facts about their environment.

EDWARD CRAIG

SOLOV'ËV, VLADIMIR SERGEEVICH (1853–1900)

It has been widely acknowledged that Vladimir Solov'ëv is the greatest Russian philosopher of the nineteenth century; his significance for Russian philosophy is often compared to the significance of Aleksandr Pushkin for Russian poetry. His first works marked the beginning of the revolt against positivism in Russian thought, followed by a revival of metaphysical idealism and culminating in the so-called Religious-Philosophical Renaissance of the early twentieth century.

Unlike the Russian idealists of the Romantic epoch, Solov'ëv was a professional, systematic philosopher. He created the first all-round philosophical system in Russia and thus inaugurated the transition to the construction of systems in Russian philosophical thought. At the same time he remained faithful to the Russian intellectual tradition of reluctance to engage in purely theoretical problems; his ideal of 'integrality' postulated that theoretical philosophy be organically linked to religion and social practice. He saw himself not as an academic philosopher, but rather as a prophet, discovering the way to universal regeneration.

One of the main themes of Solov'ëv's philosophy of history was Russia's mission in universal history. Owing to this he was interested in the ideas of the Slavophiles and, in the first period of his intellectual evolution, established close relations with the Slavophile and Pan-Slavic circle of Ivan Aksakov. He was close also to Dostoevskii, on whom he made a very deep impression. At the beginning of the 1880s he began to dissociate himself from the epigones of Slavophilism; his final break with them came in 1883, when he became a contributor to the liberal and Westernizing *Vestnik Evropy* (European Messenger). The main reason for this was the pro-Catholic tendency of his thought, which led him to believe that Russia had to acknowledge the primacy of the Pope. In his view, this was a necessary condition of fulfilling Russia's universal mission, defined as the unification of the Christian Churches and the establishment of a theocratic Kingdom of God on earth.

In the early 1890s Solov'ëv abandoned this utopian vision and concentrated on working out an autonomous ethic and a liberal philosophy of law. This reflected his optimistic faith in liberal progress and his confidence that even the secularization of ethics was essentially a part of the divine–human process of salvation. In the last year of his life, however, historiosophical optimism gave way to a pessimistic apocalypticism, as expressed in his philosophical dialogue *Tri razgovora* (Three Conversations) (1900), and especially the 'Tale of the Antichrist' appended to it.

ANDRZEJ WALICKI

SOPHISTS

The Sophists were itinerant educators, the first professors of higher learning, who appeared in Greece in the middle and later fifth century BC. The earliest seems to have been Protagoras, who was personally associated with the statesman Pericles. The next most eminent was Gorgias, an influential author and prose stylist. The Sophists succeeded in earning very large sums for their instruction. They lectured on many subjects, including the new natural philosophy, but their most important teaching was in rhetoric, the art of influencing political assemblies and law courts by persuasive speech. In conservative circles their great influence was regarded with hostility, as corrupting the young.

CHARLES H. KAHN

SOREL, GEORGES (1847–1922)

The French social theorist Georges Sorel is best known for his controversial work *Réflexions sur la violence* (*Reflections on Violence*), first published in 1908. He here argued that the world could be saved from 'barbarism' through acts of proletarian violence, most notably the general strike. This, he believed, would not only establish an ethic of the producers but would also serve to secure the economic foundations of socialism. Moreover the inspiration for these heroic deeds would be derived from a series of 'myths' that encapsulated the highest aspirations of the working class. More broadly Sorel should be seen as an innovator in Marxist theory and the methodology of the social sciences.

SOUL, NATURE AND IMMORTALITY OF THE

For the Greeks, the soul is what gives life to the body. Plato thought of it as a thing separate from the body. A human living on earth consists of two parts, soul and body. The soul is the essential part of the human – what makes me me. It is the part to which the mental life of humans pertains – it is the soul which thinks and feels and chooses. Soul and body interact. Bodily states often cause soul states, and soul states often cause bodily states. This view is known as substance dualism. It normally includes the view that the soul is simple, that it does not have parts. If an object has parts, then one of those parts can have properties which another part does not. But for any experience that I have, an auditory or visual sensation or thought, it happens to the whole me. Plato also held that at death, soul and body are separated; the body decays while the soul departs to live another life. Aristotle, by contrast, thought of the soul simply as a 'form', that is, as a way of behaving and thinking; a human having a soul is merely the human behaving (by moving parts of the body) and thinking in certain characteristic human ways. And just as there cannot be a dance without people dancing, so there cannot be ways of behaving without embodied humans to behave in those ways. Hence, for Aristotle, the soul does not exist without the body.

Christian theology, believing in life after death, found it natural to take over Plato's conception of the soul. But in the thirteenth century, St Thomas Aquinas sought to develop an Aristotelian conception modified to accommodate Christian doctrine. The soul, Aquinas taught, was indeed a form, but a special kind of form, one which could temporarily exist without the body to which it was naturally fitted. It has always been difficult to articulate this view in a coherent way which makes it distinct from Plato's. Descartes restated Plato's view. In more modern times, the view that humans have souls has always been understood as the view that humans have an essential part, separable from the body, as depicted by Plato and Aquinas. The pure Aristotelian view has more normally been expressed as the view that humans do not have souls; humans consist of matter alone, though it may be organized in a very complicated way and have properties that inanimate things do not have. In other words, Aristotelianism is a kind of materialism.

If, however, one thinks of the soul as a thing separable from the body, it could still cease to exist at death, when the body ceases to function. Plato had a number of arguments designed to show that the soul is naturally immortal; in virtue of its own nature, because of what it is, it will continue to exist forever. Later philosophers have developed some of these arguments and produced others. Even if these arguments do not show it (and most philosophers think that they do not), the soul may still be naturally immortal; or it may be immortal because God or some other force keeps it in being forever, either by itself or joined to a new body. If there is an omnipotent God, he could keep it in existence forever; and he might have revealed to us that he is going to do so.

SOUTH AMERICA, PHILOSOPHY IN

See Latin America, philosophy in

SOVEREIGNTY

In legal and political philosophy sovereignty is the attribute by which a person or institution exercises ultimate authority over every other person or institution in its domain. Traditionally, the existence of a final arbiter or legislator is said to be essential if people are to live together in peace and security. The example brought most readily to mind by the word 'sovereign' is the individual monarch, and the theory of sovereignty was at one time closely linked with the defence of monarchy. But leading theorists of sovereignty, like Jean Bodin and Thomas Hobbes, recognize that authority can be exercised by sovereign bodies of people; and later writers, like Rousseau and Austin, locate sovereignty in the people, to whom the officials of more democratic institutions are ultimately accountable.

Traditionally, too, it is deduced from the nature of the state or law that the sovereign's authority must be absolute, not limited by conditions; perpetual, not merely delegated for a time; and indivisible, not distributed between different persons or institutions. It is further deduced that the sovereign must be independent from external domination as well as internally supreme. All these inferences have been subjected to criticism, not least because they can be difficult to reconcile with the actual practice of states and legal systems.

J.D. FORD

SPACE

In some of its uses, the word 'space' designates an empty or potentially empty expanse among things, for example, when a driver finds a space in a crowded parking lot, or when a typesetter increases the space between words on a page. In other uses, 'space' is meant to stand for a boundless extension which supposedly contains everything, or every thing of a certain sort. The former sense is well-grounded in ordinary experience and can be traced back to the etymology of the word (from the Latin word *spatium*, meaning 'race-track', or generally 'distance', 'interval', 'terrain'). The latter sense originated in scholarly circles – possibly as late as the fourteenth century – by a bold extrapolation of the former; it does not refer to anything that can be exhibited in sense-perception; and yet, through the influence of Newtonian science on Euro-American common sense, it has become so entrenched in ordinary usage that it is normally viewed as the primary meaning of 'space', from which all others are derived.

According to Cornford, the 'invention of space' as a boundless, all-encompassing container happened in the fifth century BC. However, it is more likely to have occurred in the late Middle Ages. At any rate, the idea was rampant in Cambridge in the 1660s, when Newton made it a fundamental ingredient in his framework for the description of the phenomena of motion. In a posthumous paper, Newton stressed that space evades the traditional classification of entities into substances and attributes, and has 'its own manner of existence'. Until the publication of this paper in 1962, philosophers took Newtonian space for a substance, and most of them thought this to be utterly absurd. In view of the role of all-encompassing space in Newtonian physics, Kant opted for regarding it as a precondition of human knowledge, contributed once and for all by the human mind. Newton had written that the points of space owe their individual identity to the relational system in which they are set. Nineteenth-century mathematicians vastly extended this concept of space by conceiving many such relational systems. They thus made it possible for relativity theory to substitute four-dimensional spacetime for Newtonian space and time, and for current string theory to countenance a ten-dimensional physical space. These developments confirm the productivity, but not the fixity, of the knowing mind.

ROBERTO TORRETTI

SPACETIME

Spacetime is the four-dimensional manifold proposed by current physics as the arena for Nature's show. Although Newtonian physics can very well be reformulated in a spacetime setting, the idea of spacetime was not developed until the twentieth century, in connection with Einstein's theories of special and general relativity. Due to the success of special relativity in microphysics and of general relativity in astronomy and cosmology, every advanced physical theory is now a spacetime theory. *Spacetime* is undoubtedly an artificial concept, which our hominid ancestors did not possess, but the same is true of Newtonian *space* and *time*.

SPECIES

The diversity of life is not seamless but comes in relatively discrete packages, species. Is that packaging real, or an artefact of our limited temporal perspective on the history of life? If all living forms are descended from one or a few ancestors, there may be no real distinction between living and ancestral forms, or between closely related living animals.

Received wisdom holds that species are the 'units of evolution', for it is they that evolve. They are the *upshot* of evolutionary processes, but, if species and not just their component organisms compete with one another, they are also important *agents* in the evolutionary process. If so, species are real units in nature, not arbitrary segmentations of seamless variation.

The 'species problem' has been approached from two angles. One focus has been on specific taxa of the tree of life. What would settle whether some arbitrarily chosen organism is a member of *homo*

sapiens or *canis familiaris*? This is sometimes known as the 'species taxon' problem. An alternate way of approaching diversity has been to ask what all species have in common. What do all the populations we think of as species share? This is the 'species category' problem.

One idea is to group organisms into species by appealing to the overall similarity. This 'phenetic' conception is in retreat. Most contemporary species definitions are relational, the animals that compose *pan troglodytes* are a species, not because they are all very similar (they are very like the pygmy chimps as well) but because of their relations amongst themselves and with their ancestors. The most famous relational definition is the 'biological species concept', according to which conspecific organisms are organisms that can interbreed, however different they look.

Relational species definitions aim to define a category of theoretical and explanatory interest to evolutionary and ecological theory. Given that there are many explanatory interests, one problem in evaluating these accounts is to determine whether they are genuinely rivals.

SPEECH ACTS

Making a statement may be the paradigmatic use of language, but there are all sorts of other things we can do with words. We can make requests, ask questions, give orders, make promises, give thanks, offer apologies and so on. Moreover, almost any speech act is really the performance of several acts at once, distinguished by different aspects of the speaker's intention; there is the act of saying something, what one does in saying it, such as requesting or promising, and how one is trying to affect one's audience.

The theory of speech acts is partly taxonomic and partly explanatory. It must systematically classify types of speech acts and the ways in which they can succeed or fail. It must reckon with the fact that the relationship between the words being used and the force of their utterance is often oblique. For example, the sentence 'This is a pig sty' might be used nonliterally to state that a certain room is messy, and further to demand indirectly that it be tidied up. Even when this sentence is used literally and directly, say to describe a certain area of a farmyard, the content of its utterance is not fully determined by its linguistic meaning – in particular, the meaning of the word 'this' does not determine which area is being referred to. A major task for the theory of speech acts is to account for how speakers can succeed in what they do despite the various ways in which linguistic meaning underdetermines use.

In general, speech acts are acts of communication. To communicate is to express a certain attitude, and the type of speech act being performed corresponds to the type of attitude being expressed. For example, a statement expresses a belief, a request expresses a desire, and an apology expresses a regret. As an act of communication, a speech act succeeds if the audience identifies, in accordance with the speaker's intention, the attitude being expressed.

Some speech acts, however, are not primarily acts of communication and have the function not of communicating but of affecting institutional states of affairs. They can do so in either of two ways. Some officially judge something to be the case, and others actually make something the case. Those of the first kind include judges' rulings, referees' decisions and assessors' appraisals, and the latter include sentencing, bequeathing and appointing. Acts of both kinds can be performed only in certain ways under certain circumstances by those in certain institutional or social positions.

SPENCER, HERBERT (1820–1903)

Herbert Spencer is chiefly remembered for his classical liberalism and his evolutionary theory. His fame was considerable during the mid- to late-nineteenth century, especially in the USA, which he visited in 1882 to be lionized by New York society as the prophetic philosopher of capitalism. In Britain, however, Spencer's reputation suffered two fatal blows towards the end of his life. First, collectivist legislation was introduced to protect citizens from the ravages of the Industrial Revolution, and Spencer's spirited defence of economic *laissez-faire* became discredited. Second, his evolutionary theory, which was based largely on the Lamarckian principle of the inheritance of organic modifications produced by use and disuse, was superseded by Darwin's theory of natural selection. Nearly a century after his death, however, there is renewed interest in his ideas, partly because the world has become more sympathetic to market philosophies, and partly because the application of

evolutionary principles to human society has become fashionable once more.

TIM S. GRAY

SPINOZA, BENEDICT DE (1632–77)

Introduction

A Dutch philosopher of Jewish origin, Spinoza was born Baruch de Spinoza in Amsterdam. Initially given a traditional Talmudic education, he was encouraged by some of his teachers to study secular subjects as well, including Latin and modern philosophy. Perhaps as a result of this study, he abandoned Jewish practices and beliefs and, after receiving stern warnings, he was excommunicated from the synagogue in 1656. Alone and without means of support, he Latinized his name and took up the trade of lens grinder with the intention of devoting his life to philosophy. He remained in Amsterdam until 1660, lived for the next decade in nearby villages, and in The Hague from 1670 until his death from consumption in 1677. During these years he worked continuously on his philosophy and discussed it with a small circle of friends and correspondents. His masterpiece, *Ethica Ordine Geometrico Demonstrata* (*Ethics Demonstrated in a Geometrical Manner*), was completed in 1675; but because of its radical doctrines, it was only published after his death.

The full scope of Spinoza's *Ethics* is not indicated by its title. It begins with a highly abstract account of the nature of substance, which is identified with God, and culminates in an analysis of human beings, their nature and place in the universe, and the conditions of their true happiness. Written in a geometrical form modelled after Euclid, each of its five parts contains a set of definitions, axioms and propositions which are followed by their demonstrations and frequently by explanatory scholia.

The defining feature of Spinoza's thought is its uncompromising rationalism. Like other philosophers of the time, Spinoza is a rationalist in at least three distinct senses: metaphysical, epistemological and ethical. That is to say, he maintains that the universe embodies a necessary rational order; that, in principle, this order is knowable by the human mind; and that the true good for human beings consists in the knowledge of this order and a life governed by this knowledge. What is distinctive of Spinoza's brand of rationalism, however, is that it allows no place for an inscrutable creator-God distinct from his creation, who acts according to hidden purposes. Instead, Spinoza boldly identifies God with nature, albeit with nature regarded as this necessary rational order rather than as the sum-total of particular things.

In its identification of God with nature, Spinoza's philosophy is also thoroughly naturalistic and deterministic. Since nature (as infinite and eternal) is all-inclusive and all-powerful, it follows that nothing can be or even be conceived apart from it: this means that everything, including human actions and emotions, must be explicable in terms of nature's universal and necessary laws. Moreover, given this identification, it also follows that knowledge of the order of nature specified through these laws is equivalent to the knowledge of God. Thus, in sharp opposition to the entire Judaeo-Christian tradition, Spinoza claims that the human mind is capable of adequate knowledge of God.

The attainment of such knowledge is, however, dependent on the use of the correct method. In agreement with Descartes and Thomas Hobbes (the two modern philosophers who exerted the greatest influence on his thought) and thoroughly in the spirit of the scientific revolution, Spinoza held that the key to this method lies in mathematics. This conviction is obviously reflected in the geometrical form of the *Ethics*; but it actually runs much deeper, determining what for Spinoza counts as genuine knowledge as opposed to spurious belief. More precisely, it means that an adequate understanding of anything consists in seeing it as the logical consequence of its cause, just as the properties of a geometrical figure are understood by seeing them as the logical consequence of its definition. This, in turn, leads directly to the complete rejection of final causes, that is, the idea that things in nature (or nature as a whole) serve or have an end, and that understanding them involves understanding their end. Not only did Spinoza reject final causes as unscientific, a view which he shared with most proponents of the new science, he also regarded it as the source of superstition and a major obstacle to the attainment of genuine knowledge.

The same spirit underlies Spinoza's practical philosophy, which is marked by his clinical, dispassionate analysis of human nature and behaviour. In contrast to traditional moralists (both religious and secular), he rejects any appeal to a set of absolute values that are independent of human desire. Since the basic desire of every being is self-preservation, virtue is identified with the capacity to preserve one's being, the good with what is truly useful in this regard and the bad with what is truly harmful. In the case of human beings, however,

what is truly useful is knowledge; so virtue consists essentially in knowledge. This is because knowledge is both the major weapon against the passions (which are the chief sources of human misery) and, in so far as it is directed to God or the necessary order of nature, the source of the highest satisfaction.

Apart from the *Ethics*, Spinoza is best known for his contributions to the development of an historical approach to the Bible and to liberal political theory. The former is contained in the *Tractatus Theologico-politicus* (*Theological-Political Treatise*), which he published anonymously in 1670 as a plea for religious toleration and freedom of thought. The latter is contained both in that work and in the unfinished *Tractatus Politicus* (*Political Treatise*) of 1677, in which Spinoza attempts to extend his scientific approach to questions in political philosophy.

1 The geometrical method

Although Spinoza uses the geometrical method in the *Ethica Ordine Geometrico Demonstrata* (*Ethics Demonstrated in a Geometrical Manner*) (1677), he does not attempt to justify or even explain it. This has led many readers to view its argument as an intricate and fascinating chain of reasoning from arbitrary premises, which, as such, never touches reality. Nevertheless, Spinoza was very much aware of this problem and dealt with it both in an important early and unfinished work on method, *Tractatus de Intellectus Emendatione* (*Treatise on the Emendation of the Intellect*) (1677) and in some of his correspondence.

At the heart of the problem is the nature of the definitions (and to a lesser extent the axioms) on the basis of which Spinoza attempts to demonstrate the propositions of the *Ethics*. In a 1663 letter to a young friend, Simon De Vries, who queried him about this very problem, Spinoza offers his version of the traditional distinction between nominal and real definitions. The former kind stipulates what is meant by a word or thought in a concept. Such a definition can be conceivable or inconceivable, clear or obscure; but, as arbitrarily invented, it cannot, strictly speaking, be either true or false. By contrast, the real definition, which supposedly 'explains a thing as it exists outside of the understanding', defines a thing rather than a term (*The Correspondence of Spinoza*: letter 9: 106–7). Consequently, it can be either true or false.

Since the definitions of the *Ethics* are typically introduced by expressions such as 'by … I mean that', or 'a thing is called', it would seem that they are of the nominal type, which gives rise to the charge of arbitrariness. It is clear from their use, however, that Spinoza regards them as real definitions. Like the definitions of geometrical figures in Euclid, they are intended to express not merely the names used, but the objects named.

The question, then, is how can one know that one has arrived at a true definition. Spinoza's answer reveals the depth of his commitment to the geometrical way of thinking, especially to the method of analytic geometry developed by DESCARTES. He appeals to the example of the mathematician, who knows that one has a real definition of a figure when one is able to construct it. The definition of a figure is thus a rule for its construction, what is usually called a 'genetic definition'. Spinoza develops this point in *On the Emendation of the Intellect* (1677) by contrasting the nominal definition of a circle as 'a figure in which the lines drawn from the centre to the circumference are equal' with the genetic definition as 'the figure that is described by any line of which one end is fixed and the other movable'. The point is that the latter definition, but not the former, tells us how such a figure can be constructed and from this rule of construction we can deduce all its essential properties.

Spinoza's claim, then, is that the principles that apply to mathematical objects and perhaps other abstract entities also apply to reality as such. Thus, we have a real definition, an adequate, true or clear and distinct idea of a thing (all of these terms being more or less interchangeable) in so far as we know its 'proximate cause' and can see how its properties necessarily follow from this cause.

But if knowledge of a thing reduces to knowledge of its proximate cause, then either we find ourselves involved in an infinite regress, which would lead to a hopeless scepticism, or the chain of reasoning must be grounded in a single first principle. Furthermore, this first principle must have a unique status: if it is to provide the ultimate ground in terms of which everything else is to be explained, it must somehow be self-grounded or have the reason for its existence in itself. In the scholastic terminology which Spinoza adopts, it must be *causa sui* (self-caused). Thus, Spinoza's rationalist method leads necessarily to the concept of God, which he defines as 'a being absolutely infinite, i.e., a substance consisting of an infinity of

attributes, of which each one expresses an eternal and infinite essence' (*Ethics*: I, def. 6).

Given this concept, together with other essential concepts such as substance, attribute and mode (which are treated in the definitions of part one), the argument of the *Ethics* proceeds in a deductive manner. Its goal is to enable us to understand reality as a whole in light of this concept in just the same way that the mathematician can understand all the essential properties of a geometrical figure in terms of its concept or genetic definition. At least this is the project of part one of the *Ethics* (On God). The remainder of the work is devoted to the demonstration of the most important consequences of this result in so far as they concern the human condition.

2 Substance-monism

The first fourteen propositions of the *Ethics* contain an argument intended to show that 'Except God, no substance can be or be conceived' (*Ethics*: I, prop. 14). Since it follows from an analysis of the concept of substance that whatever is not itself substance must be a modification thereof, Spinoza concludes in the next proposition that 'Whatever is, is in God, and nothing can be or be conceived without God'. Together they express Spinoza's substance-monism, which can be defined as the complex thesis that there is only one substance in the universe; that this substance is to be identified with God; and that all things, as modes of this one substance are, in some sense 'in God'.

The argument for this thesis is based largely on the analysis of the concept of substance, defined as 'what is in itself and is conceived through itself, i.e., that whose concept does not require the concept of another thing, from which it must be formed' (*Ethics*: I, def. 3). This definition is quite close to Descartes who likewise made a capacity for independent existence the criterion of substance; but the two philosophers drew diametrically opposed conclusions from their similar definitions. Although Descartes held that God is substance in a pre-eminent sense, he also maintained that there are two kinds of created substance – thinking things or minds, and extended things, both of which depend for their existence on God but not on each other. For Spinoza, by contrast, there is only the one substance – God – and thought and extension are among its attributes.

Spinoza argues indirectly for his monism by criticizing the two major alternatives that a substance-based metaphysics can provide: that there is a plurality of substances of the same nature or attribute and that there is a plurality of substances with different natures or attributes. Since Descartes is committed to both forms of pluralism, both parts of the argument cut against his views. In considering Spinoza's position, however, it should be kept in mind that his target is not merely Descartes, but an entire philosophical and theological tradition which conceived of the universe as composed of a number of finite substances created by God (see MEDIEVAL PHILOSOPHY). In spite of his radical critique of scholastic ways of thinking and his appeal to mathematics as the ideal of knowledge, Descartes remained in many ways a part of that tradition.

The argument against the first form of pluralism turns on the claim that 'In nature there cannot be two or more substances of the same nature or kind' (*Ethics*: I, prop. 5). This is at once one of the most important and controversial propositions in the *Ethics*. It is important because of its pivotal role in the overall argument for monism, controversial because of the demonstration offered in its support which is based on a consideration of the grounds on which two or more substances might be distinguished. This could be done either on the basis of their attributes, if they are substances of different types (for example, Descartes' thinking and extended substances), or on the basis of their modifications, if they are distinct substances of the same kind (for example, particular minds or bodies). The claim is that neither procedure can distinguish two or more substances of the same kind; and since these are the only possible ways of distinguishing substances, it follows that such substances could not be distinguished from one another.

The unsuitability of the first alternative seems obvious and would be recognized as such by Descartes. Since a substance-type for Descartes is defined in terms of its attribute, it follows that two or more substances of the same kind could not be distinguished on the basis of their attributes. As obvious as this seems, however, it was criticized by Leibniz on the grounds that two substances might have some attributes in common and others that were distinct. For example, substance *A* might have attributes *x* and *y*, and substance *B* attributes *y* and *z*. Although a Cartesian would reject this analysis on the grounds that a substance cannot have more than one attribute, Spinoza (for whom God is a substance with infinite attributes) could hardly accept this Cartesian principle. Moreover, we shall see that it is essential to the overall argument for monism to eliminate the possibility suggested by Leibniz (see LEIBNIZ, G.W. §§4–7).

Various strategies for dealing with this problem have been suggested in the literature, perhaps the most plausible of which turns on the principle that if two or more substances were to share a single attribute, they would have to share all, and would, therefore, be numerically identical. Although

Spinoza never argues explicitly in this way, it seems a reasonable inference from his conception of attribute as 'what the intellect perceives of a substance as constituting its essence' (*Ethics*: I, def. 4). This entails that attribute *y* of substance *A* is identical to attribute *y* of substance *B* just in case they express the same nature or essence – that is, are descriptions of the same kind of thing. But if they are things of the same kind, then any attribute *A* has will be possessed by *B* as well.

Against the second alternative Spinoza argues that, since by definition substance is prior to its modifications, if we consider substance as it is in itself then we cannot distinguish one substance from another. Although the claim is surely correct, the suggestion that we set the modifications aside seems to beg the question against Descartes. After all, two Cartesian thinking substances share the same nature or attribute and are distinguished precisely by their different modifications (thoughts).

Spinoza's reasoning at this point is unclear, but one could respond that, on the hypothesis under consideration, the substances must be assumed to be indistinguishable prior to the assignment of modifications. Moreover, it follows from this that the assignment of modifications could not serve to distinguish otherwise indistinguishable substances unless it is already assumed that they are numerically distinct. In other words, while we can distinguish two Cartesian substances by means of their modifications, we can only do so by presupposing that the distinct modifications belong to numerically distinct substances. But it is just this assumption to which the Cartesian is not entitled.

3 Substance-monism (cont.)

This, however, is only the first step in the argument for monism. It is also necessary to rule out the possibility of a plurality of substances of different kinds. Essential to this project is the demonstration that substance is infinite not merely 'in its own kind', that is, unlimited by anything of the same kind, but 'absolutely infinite', that is, all-inclusive or possessing all reality, which, for Spinoza, means infinite attributes. For example, Descartes' extended substance is infinite in the first sense because it is not limited or determined by anything outside itself (for example, empty space); but it is not infinite in the second and decisive sense because it does not constitute all reality. Moreover, this is precisely why the first sense of infinity is not sufficient to preclude a plurality of substances.

The basis of the argument for the absolute infinity of substance is the claim that 'The more reality or being each thing has the more attributes belong to it' (*Ethics*: I, prop. 9). This is a direct challenge to the Cartesian conception of substance as defined in terms of a single attribute, resting on the dual assumption that some things can possess more reality than others and that this superior degree of reality is manifested in a greater number of attributes. Unfortunately, in defence of this claim Spinoza merely refers to the definition of attribute as 'what the intellect perceives of a substance as constituting its essence' (*Ethics*: I, def. 4). Nevertheless, it does seem possible to understand Spinoza's point if we interpret attributes as something like distinct descriptions under which substance or reality can be taken. Consider, for example, a simple human action such as raising an arm. Although it may be possible to give a complete neurophysiological account of such an action in terms of impulses sent to the brain, the contraction of muscles and the like, one could still argue that no such account, no matter how detailed, is adequate to understanding it as an action. This requires reference to psychological factors such as the beliefs and intentions of an agent, which in Spinoza's metaphysics belong to the attribute of thought. Thus, we might say both that there is 'more reality' to an action than is given in a purely neurophysiological account and that this 'greater reality' can be understood as the possession of a greater number of attributes.

It follows from this that a being possessing all reality – that is, God, or the *ens realissimum* (most real being) of the tradition – may be described as possessing infinite attributes. It also follows that the Cartesian must either accept the possibility of a substance with infinite attributes or deny the possibility of God. And since the orthodox Cartesian could hardly do the latter, the former must be admitted.

Even granting this, however, at least two problems remain. One is how to understand the infinity of attributes. This might mean either that substance possesses infinitely many attributes, of which the human mind knows only two (thought and extension), or that it possesses all possible attributes, which is compatible with there being only two. Although scholars are divided on the point and there are indications from Spinoza's correspondence that he held the former view, it is important to realize that the argument for monism requires only the latter. This argument turns on the claim that God is a substance that possesses all the attributes there are and, therefore, that there are none left for any other conceivable substance. Combining this with the proposition that two substances cannot share an attribute, it follows that there can be no substance apart from God.

The second problem is that the argument up to this point is completely hypothetical. It shows that *if*

we assume the existence of God, defined as a substance possessing infinite attributes, then it follows that no substance apart from God is possible; but it has not yet established the existence of substance so conceived. Spinoza had, however, laid the foundation for this claim in *Ethics* (I, prop. 7) with the demonstration that existence pertains to the nature of substance; so it remains merely to apply this result to God. This is the task of proposition eleven, which contains Spinoza's arguments for the existence of God. Spinoza offers three separate proofs, the major one being his version of the ontological argument, which was first developed by Anselm and later reformulated by Descartes (see ANSELM; DESCARTES, R. §6). Like his predecessors, Spinoza attempts to derive God's existence from the mere concept; but unlike them he makes no reference to God's perfection. Instead he appeals merely to the definition of God as a substance, from which it follows (by proposition seven) that God necessarily exists.

The nerve of the overall argument is, therefore, the proposition that existence pertains to the nature of substance or, equivalently, that its essence necessarily involves existence. Moreover, Spinoza's argument for this claim reveals the extent of his rationalism. From the premise that substance cannot be produced by anything external to itself (since such a cause would have to be another substance of the same nature, which has already been ruled out), he concludes that it must be the cause of itself, which is just to say that existence necessarily follows from its essence. Underlying this reasoning is what, at least since Leibniz, is usually termed the principle of sufficient reason, that is, the principle that everything must have a ground, reason or cause (these terms often being used interchangeably) why it is so and not otherwise. Although followers of Leibniz such as Christian WOLFF attempted to demonstrate this principle, Spinoza, like most rationalists before Kant (including Leibniz), seems to have regarded it as self-evident.

This characterization of substance as self-caused or self-sufficient being anticipates its identification with God. Quite apart from the question of its validity, however, perhaps the most interesting feature of Spinoza's argument for the necessary existence of his God-substance is that it is at the same time an argument for the non-existence of God the creator. Nevertheless, it should not be inferred from this that the result is purely negative or that Spinoza is concerned to deny the existence of God in every sense. On the contrary, his real concern in the opening propositions of the *Ethics* is to show that necessary existence and, therefore, the property of being a self-contained, self-explicated reality is to be predicated of the order of nature as a whole rather than of some distinct and inscrutable ground of this order. And this also expresses the deepest meaning of his monism.

4 God and the world

Spinoza's monism does not, however, mean the end of all dualities. In fact, the identification of God with nature leads immediately to the distinction between two aspects of nature, which he terms *natura naturans* (active or generating nature), and *natura naturata* (passive or generated nature). The former refers to God as conceived through himself, that is, substance with infinite attributes, and the latter to the modal system conceived through these attributes (which includes, but is not identical to, the totality of particular things). Consequently, the task is to explain the connection between these two aspects of nature, a task which is the Spinozistic analogue to the traditional problem of explaining the relationship between God and creation.

Like the theologians, whose procedure he adopts even while subverting their claims, Spinoza divides his analysis into two parts: a consideration of the divine causality as it is in itself (or as *natura naturans*) and a consideration of it as expressed in the modal system (or as *natura naturata*). Given what we have already seen, the former holds few surprises. The basic claim is that 'From the necessity of the divine nature there must follow infinitely many things in infinitely many ways, (i.e., everything which can fall under an infinite intellect)' (*Ethics*: I, prop. 16). Spinoza here characterizes both the nature and extent of the divine causality or power. By locating this power in the 'necessity of the divine nature' rather than creative will and by identifying its extent with 'everything which can fall under an infinite intellect', that is, everything conceivable, Spinoza might seem to be denying freedom to God. Certainly he is denying anything like freedom of choice. To object on these grounds, however, is to ignore the conception of freedom which Spinoza does affirm and to appeal to the very anthropomorphic conception of the deity against which his whole analysis is directed. To be free for Spinoza is not to be undetermined but to be self-determined (*Ethics*: I, def. 7); and God, precisely because he acts from the necessity of his own nature, is completely self-determined and, therefore, completely free.

The question of the relationship between God, so construed, and the 'infinitely many things' or modes that supposedly follow from God in 'infinitely many ways', which is perhaps the central question in Spinoza's metaphysics, is greatly complicated by the fact that Spinoza distinguishes between two radically distinct types of modes. As modifications of the one substance, both types are

dependent on and in a sense 'follow from' God, but they do so in quite different ways.

First, there are those modes that either follow directly from an attribute of substance or follow from one that does directly follow. These are termed respectively 'immediate' and 'mediate eternal and infinite modes'. They are eternal and infinite because they follow (logically) from an attribute of substance, but they are not eternal and infinite in the same manner as substance and its attributes. Although Spinoza tells us very little about these modes in the *Ethics*, we know from his correspondence and the *Short Treatise on God, Man, and his Well-Being* (*c.*1660–5) which contains the earliest statement of his system, that he regarded 'motion' or 'motion and rest', and 'intellect' or 'infinite intellect', as immediate eternal and infinite modes in the attributes of extension and thought respectively. As an example of a mediate eternal and infinite mode, he mentions only the 'face of the whole universe' (*facies totius universi*) which pertains to extension.

Given the highly schematic and fragmentary nature of the surviving accounts of these eternal and infinite modes, any interpretation is hazardous. Nevertheless, both their systematic function as mediators between God or substance and the particular things in nature (finite modes), and the names chosen for the modes of extension, suggest that the latter are best construed as the fundamental laws of physics. In fact, Spinoza's characterization of motion and rest as an eternal and infinite mode may be seen as his attempt to overcome a basic difficulty in Cartesian physics. Having identified matter with extension, Descartes could not account for either motion or the division of matter into distinct bodies without appealing to divine intervention. On Spinoza's view, however, this is not necessary, since extended substance has its principle within itself. Otherwise expressed, matter is inherently dynamical, a property which cannot be explained in terms of Descartes' purely geometrical physics.

The 'face of the whole universe', which is identified with corporeal nature as a whole, may be understood in a similar fashion. By claiming that this is a mediate eternal and infinite mode of extension following directly from motion and rest, Spinoza is implying that the proportion of motion and rest in corporeal nature as a whole remains constant, even though it may be in continual flux in any given region. Moreover, this is equivalent to affirming the principle of the conservation of motion, which is a basic principle of Cartesian physics.

Viewing Spinoza's account in the light of seventeenth-century physics also helps to understand his doctrine of finite modes, or the series of particular things, which is usually regarded as one of the more problematic aspects of his metaphysics. The problem is how to conceive the relationship between the series of these modes and God. If one assumes that, like the mediate eternal and infinite modes, they follow mediately from the attributes of God, then they too become eternal and infinite; but this is absurd, since it is of the essence of such modes to be transitory. If, however, one denies that they follow from God at all, then the dependence of all things on God, and with it Spinoza's monism, is negated. Accordingly, it must be explained how, in spite of their finitude, particular things and occurrences depend on God and participate in the divine necessity.

Spinoza's solution to this dilemma consists in claiming that the series of finite modes constitutes an infinite causal chain, wherein each finite mode is both cause and effect of others, *ad infinitum*, while the entire series (viewed as a totality) is dependent on the attributes of God and the eternal and infinite modes. Expressed in scientific terms, this means that every occurrence in nature is to be understood in terms of two intersecting lines of explanation. On the one hand, there is a set of general laws which for Spinoza are logically necessary (since they follow from the divine attributes); on the other hand, there must be a set of antecedent conditions. Both are required to explain a given phenomenon, say a clap of thunder. Clearly, no such explanation is possible without appealing to the relevant physical laws; but of themselves these laws are not sufficient to explain anything. It is also necessary to refer to the relevant antecedent conditions: in this case the state of the atmosphere. But, given these laws and the atmospheric state at t_1, it is possible to deduce the occurrence of thunder at t_2. And this means that nature is to be conceived as a thoroughly deterministic system.

Spinoza concludes from this that 'In nature there is nothing contingent, but all things have been determined from the necessity of the divine nature to exist and to produce an effect in a certain way' (*Ethics*: I, prop. 29). But because of this denial of contingency, he is sometimes accused of conflating determinism with the stronger thesis (usually termed 'necessitarianism') according to which the entire order of nature, that is, the infinite series of finite modes, could not have been different. The point is that determinism entails merely that, given the laws of nature and the set of appropriate antecedent conditions, any particular occurrence is necessary; but this leaves room for contingency, since it leaves open the possibility of a different set of antecedent conditions.

In response, one might distinguish between a consideration of finite modes, or a subset thereof,

taken individually and a consideration of the series of such modes as a whole. The former fails to eliminate contingency, since any particular mode or subset of modes, viewed in abstraction from the whole, can easily be thought (or imagined) to be different. But the same cannot be said of the series taken as a whole. Since this series (considered as a totality) depends on God, it could not be different without God being different (which is impossible). The problem here is with the idea that the set of modes as a whole requires an explanation or grounding distinct from that of its constituent elements. Such a move is usually dismissed as a 'category mistake' (treating a collection as if it were a higher-order individual). But if it is a mistake, it is one to which Spinoza is prone in virtue of his rationalism; for nothing could be less Spinozistic than the idea that while particular events may be intelligible, the order of nature as a whole is not. And since for Spinoza making something intelligible involves demonstrating its necessity, this commits him to necessitarianism.

5 The human mind

Just as the target of part one of the *Ethics* is the dualism of God and created nature, so that of part two is the dualism of mind and body. Rather than holding with Descartes that the mind and the body are two distinct substances that somehow come together to constitute a human being, Spinoza maintains that they constitute a single individual expressed in the attributes of thought and extension. Since the fundamental modifications of thought are ideas (other modifications, such as desires and volitions, presuppose an idea of their object), while those of extension are bodies, this means that the human mind is an idea of a rather complex sort and that together with its correlate or object in extension (the body), it constitutes a single thing or individual. The great attractiveness of this view, particularly when contrasted with both Descartes' dualism and Hobbes' reductive materialism, is that it allows for the conception of persons as unified beings with correlative and irreducible mental and physical aspects (see HOBBES, T.). Unfortunately, this attractiveness is diminished considerably by its inherent obscurity. How can the mind be identified with an idea (even a very complex one)? And how can such an idea constitute a single thing with its object?

The place to begin a consideration of these questions is with Spinoza's elusive conception of an idea, which he defines as 'a conception of the mind that the mind forms because it is a thinking being' (*Ethics*: II, def. 3). As he makes clear in his explication of this definition through the distinction between conception and perception, the emphasis falls on the activity of thought. To say that the mind has the idea of *x* is to say that it is engaged in the activity of conceiving *x*, not merely passively perceiving its mental image. Indeed, in one sense of the term, an idea for Spinoza just is the act of thinking. Moreover, this helps to remove at least some of the mystery in the identification of the mind with an idea. On the Spinozistic view, this means that the mind is identified with its characteristic activity, thinking; that its unity is the unity of this activity.

As acts of thinking, ideas may be identified with beliefs or 'believings'; but this reflects only one dimension of Spinoza's conception of an idea. For beliefs have propositional content and this, too, is an essential aspect of every idea. In short, ideas have both psychological and logical (or epistemological) properties. Moreover, although Spinoza is often charged with conflating these, he was well aware of the difference and of the importance of keeping them apart. This is evident from his appeal to the scholastic distinction, also invoked by Descartes, between the 'formal' and the 'objective reality' of ideas. The former refers to the psychological side of ideas as acts of thinking or mental events, the latter to their logical side or propositional content. Construed in the former way, ideas have causes which, in view of the self-contained nature of each attribute, are always other ideas. Construed in the latter way, they have rational grounds which likewise are always other ideas.

Spinoza differs from Descartes, however, in his understanding of the objective reality of ideas. For Descartes, talk about the objective reality of an idea as it exists in someone's mind refers to that idea *qua* intentional object to which a 'real' (extramental) object may or may not correspond. For Spinoza, by contrast, the idea viewed objectively just is its object (a corresponding mode of extension) as it exists in thought. This is a direct consequence of Spinoza's mind–body monism and we shall see that it has important implications for his epistemology.

6 The human mind (cont.)

Our immediate concern, however, is with the implications of this conception of ideas for Spinoza's account of the mind–body relationship. Unquestionably, the key feature in this account is the principle that 'The order and connection of ideas is the same as the order and connection of things' (*Ethics*: II, prop. 7). Taken by itself, this might be viewed as the assertion of a parallelism or isomorphism between the two orders, thereby leaving open the possibility that the elements

contained in these orders might be ontologically distinct, as, for example, in Leibniz's pre-established harmony (see LEIBNIZ, G.W. §§4–7). In the scholium attached to this proposition, however, Spinoza indicates that he takes it to entail something more. Thus, he explains that just as thinking and extended substance are 'one and the same substance, comprehended now under this attribute and now under that. So also a mode of extension and the idea of that mode are one and the same thing, but expressed in two ways' (*Ethics*: II, prop. 7). In other words, rather than there being two series, one of extended things and the other of ideas, there is only a single series of finite modes, which may be regarded from two points of view, or taken under two descriptions. This also defines the sense in which Spinoza affirms an identity between mind and body. In claiming that mind and body constitute the same thing, he is not asserting that ultimately there is only one set of properties (which would make him a reductionist like Hobbes); rather, he is denying that the two sets of properties or, better, the two descriptions, can be assigned to two ontologically distinct things (as they are for Descartes).

Although the proposition makes a completely general claim about the relationship between the attributes of thought and extension, and their respective modifications, it also provides the metaphysical foundation for Spinoza's descent from the attribute of thought to its most interesting finite modification – the human mind. The descent is somewhat circuitous, however, since in subsequent propositions Spinoza stops to dwell on some topics that do not seem directly germane, such as the status of ideas of non-existent things; but the main line of the argument is clear enough. As a finite mode of thought, the essence of the mind must be constituted by an idea. Since the mind itself is something actual (an actual power of thinking), it must be the idea of an actually existing thing. And since this actually existing thing can only be a corresponding modification of extension, that is, a body, Spinoza concludes that 'The object of the idea constituting the human mind is the body, or a certain mode of extension which actually exists, and nothing else' (*Ethics*: II, prop. 13).

Even if one accepts Spinoza's premises and the chain of reasoning leading to the conclusion, this 'deduction' of the human mind as the idea of the body raises at least two major questions. One is how to reconcile the identification of the body as the unique object of the mind with the capacity of the mind to know and, therefore, presumably, to have ideas of things quite distinct from the body with which it is identified. This will be discussed in the next section in connection with Spinoza's epistemology. The other question concerns how this enables us to understand what is distinctive about the human mind. As Spinoza himself remarks in the scholium to proposition thirteen, this result is perfectly general, applying no more to human beings than to other individuals. And, by way of accentuating the point, he adds that these other individuals are 'all animate [*animata*], albeit in different degrees'. Now, given the principles of Spinoza's metaphysics, it certainly follows that there must be 'in God' an idea corresponding to every mode of extension in the same way as an idea of a human body corresponds to that body. Thus, the claim that the human mind is the idea of the body may serve to determine its ontological status, but it does not enable us to understand its specific nature and activity. But unless Spinoza's deduction of the mind can accomplish this result, it cannot be judged a success, even on his own terms. Moreover, by suggesting that all individuals in nature are to some extent *animata*, he introduces a fresh element of paradox into his discussion. Indeed, this is particularly so if we take Spinoza to be claiming that something like a soul, or a rudimentary mind, must be attributed to all individuals.

Since the Latin '*animatus*' is cognate with the English 'animate', the sense of paradox can be lessened somewhat if we take the claim to be merely that all individuals are alive. Although this itself might seem bizarre, it becomes more plausible when one considers Spinoza's conception of life which, in the appendix to his early work *Descartes's 'Principles of Philosophy'*, he defines as 'the force through which things persevere in their being'. Since, as we shall see, Spinoza's conatus doctrine consists in the claim that each thing, in so far as it can, strives to preserve its being, it follows that every thing is in this sense 'alive'. And from this it is perhaps not too large a step to the conclusion that every thing has a 'soul' in the sense of an animating principle. But, of course, it does not follow from this that everything has a mental life that is even remotely analogous to that enjoyed by the human mind.

This makes it incumbent on Spinoza to account for the different degrees of animation and to explain thereby the superiority of the human mind to the 'minds' of other things in the order of nature. And he proceeds to do so by focusing on the nature of body. In essence, Spinoza's view is that 'mindedness' is a function of organic complexity; so the greater the capacity of a body (that is, brain and central nervous system) to interact with its environment, the greater the capacity of the mind to comprehend it. Thus, in a kind of speculative biophysics, Spinoza attempts to demonstrate that the human body is, indeed, a highly complex individual, which stands

in a complex and reciprocal relationship with its environment. Although this account is extremely cryptic, it is also highly suggestive and points in the direction of an analysis of the phenomenon of life that goes far beyond the crude mechanism of the Cartesians (for whom the body is merely a machine). Perhaps more to the point, it also provides a theoretical basis for locating conscious awareness and rational insight on a continuum of mental powers, all of which are strictly correlated with physical capacities, rather than viewing them with Descartes as unique properties of a distinct mental substance.

7 Theory of knowledge

Although Spinoza does not assign to epistemological questions the priority given them by Descartes and the British empiricists, he certainly does not neglect them. In fact, his analysis of human knowledge, which follows directly upon his account of the mind, may be viewed as an attempt to show how the human mind, so conceived, is capable of the kind of knowledge presupposed by the geometrical method of the *Ethics*. In Spinoza's own terms, this means that what must be shown is nothing less than that the human mind is capable of adequate knowledge of the eternal and infinite essence of God.

Since adequate knowledge rests on adequate ideas, Spinoza must demonstrate that the human mind possesses such ideas. He defines an adequate idea as one which 'considered in itself, without relation to an object, has all the properties or intrinsic denominations of a true idea' (*Ethics*: II, def. 4). The term 'intrinsic' functions to rule out the extrinsic feature of a true idea: namely, agreement with its object. Thus, Spinoza's view is that truth and adequacy are reciprocal concepts: all adequate ideas are true (agree with their object) and all true ideas are adequate. Moreover, this enables him to dismiss the radical doubt regarding even our most evident conceptions envisaged by Descartes, which is supposedly overcome only by the manifestly circular appeal to God as the guarantor of truth. Since adequacy is an intrinsic feature of all true ideas, it serves as the criterion of truth. Consequently, someone who has a true idea immediately recognizes it as such and there is no longer room for Cartesian doubt. As Spinoza puts it with uncharacteristic elegance: 'As the light makes both itself and the darkness plain, so truth is the standard both of itself and of the false' (*Ethics*: II, prop. 43, scholium).

The intrinsic property through which truth manifests itself is explanatory completeness. An idea of *x* is adequate and, therefore, true just in case it suffices for the determination of all of the essential properties of *x*. For example, the mathematician's idea of a triangle is adequate because all of the mathematically relevant properties of the figure can be deduced from it. Conversely, the conception of a triangle by someone ignorant of mathematics is inadequate because it is incapable of yielding any such consequences.

It does not follow from this, however, that inadequate ideas are simply false. On the contrary, since every idea agrees with its object, every idea must in some sense be true. Specifically, 'All ideas, insofar as they are related to God, are true' (*Ethics*: II, prop. 32). Error or falsity arises because not every idea possessed by the human intellect is related by that intellect to God, that is, viewed as a determinate member of the total system of ideas. In other words, error or falsity is a function of incomplete comprehension, of partial truth being taken as complete. Spinoza illustrates the point by an example also used by Descartes: the imaginative, non-scientific idea of the sun as a disk in the sky located a few hundred feet above the earth. This idea is 'true' in so far as it is taken as an accurate representation of how the sun appears to us under certain conditions; but since it is not understood in this way by someone ignorant of optics and astronomy, such a person's idea is false in the sense of being inadequate or incomplete. It is not, however, 'materially false' in the Cartesian sense that there is nothing in the realm of extension corresponding to it.

Correlative with the distinction between inadequate and adequate ideas is a contrast between two mutually exclusive ways in which ideas can be connected in the mind: either according to the 'common order of nature' or the 'order of the intellect'. The former refers to the order in which the human mind receives its ideas in sense perception or through imaginative association. Since these correspond exactly to the order in which the body is affected by the objects of these ideas, it reflects the condition of the body in its interaction with its environment rather than the true nature of an independent reality. And from this Spinoza concludes that all such ideas are inadequate. In fact, he argues that, in so far as its ideas reflect this order or, equivalently, are based on sense perception or imagination, the mind is incapable of adequate knowledge of either external objects in nature, its own body or even of itself. Spinoza also contends, however, that adequate knowledge of all three is possible in so far as the mind conceives things according to the order of the intellect, that is, the true order of logical and causal dependence, which, once again, is precisely why the correct method is so essential.

8 Theory of knowledge (cont.)

The central problem of Spinozistic epistemology is thus to explain how conception according to the order of the intellect is possible for the human mind. This is a problem because the possibility of such conception seems to be ruled out by the ontological status of the mind as the idea of the body. For how could a mind, so conceived, have any ideas that do not reflect the condition of its body? The gist of Spinoza's answer is that there are certain ideas that the human mind possesses completely and hence can conceive adequately because, unlike ideas derived from sense perception or imagination, they do not 'involve', or logically depend on, ideas of particular modifications of the body.

Spinoza's doctrine is particularly obscure at this point; but it is perhaps best approached by comparing it to the doctrine of innate ideas, which was appealed to by Descartes and later Leibniz to deal with a similar problem. Like Spinoza, they held that sensory experience cannot account for the possibility of knowledge of necessary and universal truth. Instead, they claimed that the source of such knowledge must lie in the mind and reflect its very structure. This was not understood in a naïve psychological sense, however, as if an infant were born with knowledge of the basic principles of mathematics. Rather, innate ideas were viewed more as dispositions that pertain essentially to the human mind, but of which individuals are not necessarily conscious.

Although Spinoza's account of the mind as the idea of the body precludes the distinction drawn by Descartes between innate and adventitious ideas (that is, those that come from the mind and those that come from sensory experience), it does allow for an analogous distinction, which leads to much the same result. This is the distinction between ideas that are correlated with specific features of particular bodies and those whose correlates are common to all bodies or a large proportion thereof. The latter fall into two classes, corresponding to two levels of generality, which Spinoza terms respectively 'common notions' and 'adequate ideas of the common properties of things'. Their distinctive feature is that they do not arise in connection with an encounter with any particular kind of thing; and this enables Spinoza to claim that the mind possesses them in their totality and comprehends them adequately. Unfortunately, he does not provide examples of either class of these adequate ideas; but it seems reasonable to assume that the common notions include the axioms of geometry and first principles of physics (which are common to all bodies). Correlatively, since the adequate ideas of common properties of things correspond to properties that are common and peculiar to the human body and to other bodies by which it is affected (*Ethics*: II, prop. 39), it is likely that Spinoza was here referring to the basic principles of biology (or perhaps physiology). In any event, the crucial point is that the commonality of these ideas enables the human mind to grasp them completely, which is what is required for adequate knowledge.

The epistemological teaching of the *Ethics* culminates in the distinction between three kinds of knowledge (*Ethics*: II, prop. 40, scholium 2). The first is an experientially determined knowledge, which can be based either on the perception of particular things or on signs, which for Spinoza includes both sensory and memory images. The second is knowledge through reason, which is based on common notions and ideas of the common properties of things. Since the former mode of knowledge involves inadequate ideas and the latter adequate ones, this is just the contrast one would expect. At this point, however, Spinoza unexpectedly introduces a third kind of knowledge, termed 'intuitive knowledge' (*scientia intuitiva*), which supposedly 'proceeds from an adequate idea of the formal essence of certain attributes of God to the adequate knowledge of the essence of things'. He also attempts to clarify the difference between all three by comparing their respective treatments of the problem of finding a fourth proportional. Someone with the first kind of knowledge proceeds by rule of thumb, multiplying the second by the third and dividing the product by the first, thereby arriving at the correct answer without really understanding the principle at work. Someone with the second kind understands the principle and is, therefore, able to derive the result from the common property of proportionals as established by Euclid. Someone who possesses the third kind of knowledge, however, immediately grasps the result, without applying a rule or relying on a process of ratiocination.

Although both reason and intuition are sources of adequate knowledge, Spinoza recognizes two senses in which intuition is superior. First, whereas the province of reason concerns general truths based on common notions and consequently is abstract and general, that of intuition concerns the individual case and consequently is concrete and particular. This difference is not directly germane to Spinoza's epistemology, but it plays a significant role in his practical philosophy. Second, and of more immediate relevance, knowledge from general principles alone remains ultimately ungrounded. Accordingly, as in Spinoza's example, while the conclusion is inferred correctly from the principle, the status of the principle itself remains in question.

Within the framework of Spinoza's metaphysics, this question can be resolved only by grounding the principle in the nature of God, which is supposedly what is accomplished by intuitive knowledge.

But grounding our knowledge of things in the eternal and infinite essence of God obviously presupposes a knowledge of that essence; and even for a rationalist such as Descartes, this far transcends the capacity of the human intellect. This is not the case for Spinoza, however, given his unique conception of God. Since 'it is of the nature of reason to regard things as necessary, not as contingent' (*Ethics*: II, prop. 44), and since to conceive things in this way is to conceive them in relation to God, Spinoza in effect concludes that in so far as the mind has an adequate idea of anything at all, it must have an adequate idea of God. Moreover, since it presumably has been established that the human mind knows some things (has some adequate ideas), it follows that the mind has an adequate idea of God. Although initially this seems paradoxical in the extreme, it becomes much less so if one keeps in mind the nature of Spinoza's God.

9 The emotions

Nowhere is Spinoza's unique combination of rationalism and naturalism more evident than in his doctrine of the emotions, the topic of the third part of the *Ethics*. Appealing to the conception of the mind as the idea of the body, he defines the emotions or affects (*affectiones*) as 'affections of the body by which the body's power of acting is increased or diminished, aided or restrained, and at the same time, the ideas of these affections' (*Ethics*: III, def. 3). Emotions are, therefore, directly related to the body's capacity for action or level of vitality and have both a physiological and a psychological side. Moreover, given mind–body identity, these are seen as distinct expressions of the same thing. Thus, a conscious desire for some object and a corresponding bodily appetite are the same state considered under the attributes of thought and extension respectively.

Among other things, Spinoza's conception of mind precludes the assumption of a distinct power of will through which the mind can exert control over the bodily appetites. Strictly speaking, there is nothing pertaining to the mind but ideas, that is, acts of thinking; but these ideas have a conative or volitional and affective as well as a cognitive dimension. In other words, to have an idea of *x* is to have not only a belief or propositional attitude with respect to *x*, but also some sort of evaluative attitude (pro or con). Moreover, this enables Spinoza to avoid concluding from his denial of will that the mind is powerless, condemned to being the passive observer of the bodily appetites. The mind, for Spinoza, is active in so far as it is the 'adequate', that is sufficient, cause of its states; and it is such in so far as it possesses adequate ideas, that is, in so far as its desires and hence its 'decisions', are grounded in rational considerations – for example, when it desires a particular food because of the knowledge (adequate idea) that it is nutritious. Conversely, it is passive when its desires reflect inadequate ideas connected with sense perception and imagination.

But regardless of whether it is active or passive, the mind's evaluative attitude is always an expression of its conatus, which is identified with the endeavour of each thing to persist in its own being. This endeavour pertains to the nature of every finite mode; but in human beings, who are conscious of this endeavour, it becomes the desire for self-preservation. Spinoza thus agrees with Hobbes in regarding this desire as the basic motivating force in human behaviour. But rather than inferring this from observation, he deduces it from the ontological status of human beings as finite modes. This allows him to affirm not merely that this desire is, as a matter of fact, basic to human beings, but that it constitutes their very essence. Accordingly, one can no more help striving to preserve one's being than a stone can help falling when it is dropped.

Perhaps under the influence of Hobbes, Spinoza also identifies this endeavour to preserve one's being with a striving for greater perfection, understood as an increased power of action. Just as Hobbes insisted that individuals continually desire to increase their power because there can never be any assurance that it is sufficient for self-preservation, so Spinoza maintains that the endeavour of an organism to preserve its existence is identical to its effort to increase its power of acting or level of vitality. This is because anything that lessens an organism's power, lessens its ability to preserve its being, while anything that increases this power enhances that ability.

The so-called primary emotions (pleasure, pain and desire) are correlated with the transition from one state of perfection or level of vitality to another. Thus, pleasure or joy (*laetitia*) is defined as the emotion whereby the mind passes to a greater state of perfection, and pain or sorrow (*tristitia*) is that by which it passes to a lesser state. Both reflect changes brought about in the organism through interaction with its environment. Although particular desires are directly related to pleasures, desire is none the less a distinct primary emotion because a desire for a particular object viewed as a source of pleasure is distinct from that pleasure.

The great bulk of part three of the *Ethics* is devoted to showing how the other emotions can be

derived from the primary ones by means of combination and association with other ideas. Central to this project is the thesis that pleasure, pain and desire relate to present objects, which cause the affections of the body to which these emotions (as ideas) correspond. Accordingly, the derivative emotions are all species or combinations of pleasure, pain or desire, which are directed in various ways either to objects that do not presently affect the body or to those that are not themselves directly the cause of these affections. For example, love and hatred are defined respectively as pleasure and pain accompanied by the idea of an external cause. Similarly, hope and fear are understood as pleasures and pains that arise under conditions of uncertainty, when the image of some past or future thing is connected with an outcome that is in doubt. This analysis is extended with considerable subtlety, showing, among other things, how ambivalence is possible; and how, through various forms of association, the mind can come to feel love, hatred, hope or fear towards things with regard to which it has no direct desire or aversion. The key point, however, is that, like everything else in nature, these emotions do not arise capriciously, but in accordance with universal and necessary laws.

But these laws concern the mind only in so far as it is passive, that is, in so far as its ideas are inadequate and it is, therefore, only the partial or inadequate cause of its affections. Accordingly, at the end of his lengthy account of the passive emotions or passions, Spinoza turns briefly to the active emotions, which are connected with adequate ideas. Of the three primary emotions, only desire and pleasure have active forms, because only they can be grounded in adequate ideas. Active desire has already been described; it is simply rational desire. Active pleasure is a concomitant of all adequate cognition; for when the mind cognizes anything adequately it is necessarily aware of this and, therefore, of its own power or activity. And it is the awareness of its activity, not the nature of the object known, that is the source of pleasure. Finally, since pain or sorrow reflects a diminution of the mind's power of activity (adequate ideas), Spinoza concludes that it can never be the result of this activity, but must always result from the mind's inadequate knowledge and determination by external forces.

10 Moral theory

Spinoza's moral theory is based on his analysis of the emotions and is formulated with the same clinical detachment as the remainder of the *Ethics*. In sharp contrast to Judaeo-Christian moralists and their secular counterparts, he proposes neither a set of obligations nor a list of actions, the performance of which make one morally 'good', and their omission or neglect morally 'evil': all such moral systems and concepts are based on inadequate ideas, particularly the ideas of free will and final causes. Instead, he is concerned to determine the means through which and the extent to which human beings, as finite modes, are capable of attaining freedom, understood as the capacity to act rather than to be governed by the passions. Morality in the traditional sense is, therefore, replaced by a kind of therapy, which is one reason why Spinoza is frequently compared with FREUD. The concept of virtue is retained; but it is given its original meaning as power, which is itself understood in light of the conatus doctrine as the power to preserve one's being. In the same spirit, the good is identified with what is truly useful in this regard and the bad with what is truly harmful.

In spite of his amoralism, Spinoza does not equate virtue with the ability to survive or the good with what is in one's self-interest, narrowly conceived. What matters is not mere living, but living well; and this means being active – that is, being, to the fullest extent possible, the adequate cause of one's condition. And since being an adequate cause is a function of adequate ideas, virtue is directly correlated with knowledge. Knowledge, however, has a dual role in the Spinozistic scheme. It is the major weapon in the struggle against the passions, since it is through understanding our passions and their causes that we are able to gain some measure of control over them. But it is also itself constitutive of the good life, since our freedom is manifested essentially in the exercise of reason.

Nevertheless, Spinoza was under no illusions about the extent of the power of reason. Human virtue or perfection is merely relative and its attainment a rare and difficult feat. Thus, the first eighteen propositions of part four of the *Ethics*, which is significantly entitled 'On Human Bondage, or the Powers of the Affects', are concerned with the limits of the power of reason in its conflict with the passions. The basic point is that, as finite modes, the force through which human beings endeavour to preserve their being is infinitely surpassed by other forces in nature and, therefore, to some extent at least, they will always be subject to the passions. Moreover, knowledge itself has no motivating power simply *qua* knowledge, but only in so far as it is also an affect. Now knowledge is, indeed, an affect for Spinoza, since all ideas have an affective component, that is, possess a certain motivational force. But, as he attempts to demonstrate by means of an elaborate psychodynamics, the affective component of even an adequate idea is strictly

limited and can easily be overcome by other (inadequate) ideas, which is why rational desires, based on a knowledge of what is truly beneficial, all too frequently give way to irrational urges.

After his analysis of human weakness, Spinoza turns to the question of what reason, limited as its power may be, prescribes. The basic answer, of course, is knowledge and, given Spinoza's metaphysics and epistemology, this ultimately means knowledge of God. Thus, he concludes that 'Knowledge of God is the mind's greatest good; its greatest virtue is to know God' (*Ethics*: IV, prop. 28). At this point, however, the discussion takes a surprising turn, one which indicates both the complexity of, and the inherent tensions in, Spinoza's thought. For while this austere intellectualism suggests the picture of the isolated, asocial thinker, devoted exclusively to the life of the mind, what is affirmed instead is the essentially social character of human existence. For Spinoza, as for Aristotle, human beings are social animals; and the life lived under the guidance of reason is, at least to some extent, a social life (see ARISTOTLE §22). This is not because human beings are intrinsically altruistic, but rather because, as relatively limited and weak finite modes, they are ineluctably interdependent. Thus, Spinoza argues that those who live under the guidance of reason desire nothing for themselves that they do not also desire for others (*Ethics*: IV, prop. 37). This reflects his undoubtedly idealized portrait of those devoted to the life of the mind. In so far as this devotion is pure (which it can never be completely), such individuals will not come into conflict because the good which they all seek, knowledge, can be held in common. In fact, not only will genuine seekers after truth not compete, they will cooperate; for in helping others acquire knowledge and the control of the passions that goes with it, one is also helping oneself. Moreover, although only the few capable (to some extent) of living under the guidance of reason may be able to grasp adequately and, therefore, internalize this truth, the need for cooperation applies to all; for all are members of the same human community of interdependent beings.

11 Moral theory (cont.)

Spinoza's account of the specific virtues reflect his general principles. These virtues are identified with certain affects or emotional states and their value is regarded as a function of their capacity to promote an individual's conatus. For this purpose the affects are divided into three classes: those that are intrinsically good and can never become excessive (the virtues); those that are intrinsically bad; and a large group that are good in moderation but bad if they become excessive. In identifying the virtues with affects that can never become excessive, Spinoza differs from Aristotle for whom virtues are regarded as means between two extremes.

Paramount in the group of virtuous affects is pleasure or joy. Since it reflects in the attribute of thought an increase in the body's power of activity, it can never be harmful. This gives Spinoza's thought a strongly anti-ascetic tone which stands in sharp contrast to the Calvinistic austerity of many of his countryman. Nevertheless, it is crucial to distinguish between genuine pleasure, which reflects the wellbeing of the organism as a whole, and titillation (*titillatio*) or localized pleasure, which merely reflects that of a part. Although the latter can be good, it can also be quite harmful. Other affects in this mixed category include cheerfulness and self-esteem. In the latter case, the crucial factor is whether or not the affect is grounded in reason. Pride, or self-esteem, without any rational basis is obviously harmful and is to be avoided at all costs. But, in so far as self-approval arises from an adequate idea of one's power, it is the highest thing we can hope for, since it is simply the consciousness of one's virtue. Perhaps even more than his anti-asceticism, this indicates how much closer Spinoza is to the classical ideal of the virtuous life than he is to traditional religious morality.

In addition to pain, Spinoza assigns first place among the intrinsically harmful affects to hate. Closely associated with hate, and rejected in similarly unqualified terms, are affects such as envy, derision, contempt, anger and revenge. These might be termed the social vices, since they serve to alienate human beings from one another. It is also noteworthy that Spinoza here locates many of the traditional religious virtues: hope, fear, humility, repentance and pity. Since they all reflect ignorance and lack of power, they cannot be regarded as beneficial, or assigned any place in the life of reason. Nevertheless, in a concession to human frailty, Spinoza does acknowledge that because human beings rarely live in this manner, these affects have a certain pragmatic value as checks on our more aggressive tendencies.

The affects that can be either good or bad include – besides titillation – desire and love. If directed towards an object that stimulates or gratifies a part of the organism or one of its appetites at the expense of the whole, they can become excessive and hence harmful. And this is precisely what occurs in pathological states such as avarice, ambition, gluttony and, above all, lust. In spite of his generally anti-ascetic attitude, Spinoza tended to regard sexual desire as an unmitigated evil. In sharp contrast to it stands the one kind of love that can never become excessive: the love of God.

12 The love of God and human blessedness

Although it does not enter into the account of virtue, the love of God plays a central role in the final part of the *Ethics*. The situation is complicated, however, by the fact that this part deals with two distinct topics, which may be characterized as mental health and blessedness; and the love of God is crucial to both. The question of health is the subject of the first twenty propositions, which are concerned with reason's unremitting struggle with the passions. Here Spinoza functions explicitly as therapist, providing his alternative not only to the religious tradition, but also to the training of the will advocated by the Stoics and Descartes (see STOICISM). Since what is crucial is that, as far as possible, one be moved by pleasurable thoughts (rather than reactive, negative affects), Spinoza's account amounts to an essay on the power of positive thinking. Moreover, since the ultimate positive thought is the love of God, this love serves as the chief remedy against the passions.

In spite of the religious language in which it is expressed, this claim is readily understandable in Spinozistic terms. Since by 'love' is meant simply pleasure accompanied by the idea of its cause, any pleasure accompanied by God as its cause counts as the love of God. But all adequate cognition is both inherently pleasurable, since it expresses the activity of the mind, and involves the idea of God as cause, since it consists in an idea of the object as following from God (the third kind of knowledge). Thus, the adequate knowledge of anything involves the love of God as its affective dimension. Moreover, since, in principle at least, it is possible to acquire an adequate idea of any modification of substance, it follows that this love can be occasioned by virtually anything. Consequently, it is its potential ubiquity, together with its superior affective force as expression of pure activity, that qualifies this love-knowledge of God as the supreme remedy against the passions.

In the second half of part five, the love of God is now explicitly characterized as 'intellectual' and paradoxically identified with the love with which God loves himself. And if this were not puzzling enough, Spinoza introduces the new discussion by proclaiming: 'With this I have completed everything which concerns this present life . . . so it is now time to pass to those things which pertain to the mind's duration without relation to the body' (*Ethics*: V, prop. 20, scholium). This sets the agenda for the final propositions, the basic concern of which is to show that 'The human mind cannot be absolutely destroyed with the body, but something of it remains which is eternal' (*Ethics*: V, prop. 23). It is within this context that Spinoza refers to the intellectual love of God.

Because of their apparent incompatibility with the central teachings of the *Ethics*, these final propositions remain a source of perplexity. Nevertheless, it does seem possible to make sense of Spinoza's thought here, if we see it in the context of a shift of focus from the concern with reason (including the love of God) in its struggle with the passions, to a concern with the life of reason as the highest condition of which human beings are capable and, therefore, as constitutive of human blessedness. So construed, the abrupt change of tone is simply Spinoza's way of marking that shift rather than an indication of a lapse into a mysticism that is totally at variance with the spirit of his philosophy. Such a reading leads to an essentially epistemological rather than a metaphysical reading of the doctrine of the eternity of the mind. According to this reading, the human mind is 'eternal' to the extent to which it is capable of grasping eternal truth and ultimately of understanding itself by the third kind of knowledge, which, in turn, leads to the intellectual love of God. To be sure, this is not the eternal life promised by religion; but it is a state of blessedness or perfection in the sense that it involves the full realization of our capacities. Moreover, it is precisely the mode of life to which the *Ethics* as a whole points the way.

Such a reading is also supported by the final proposition in which Spinoza returns to the theme of virtue and links it with both health and blessedness. As he there puts it, 'Blessedness is not the reward of virtue, but virtue itself; nor do we enjoy it because we restrain our lusts; on the contrary, because we enjoy it, we are able to constrain them' (*Ethics*: V, prop. 41). There is not a trace of mysticism here, but merely the familiar Spinozistic emphasis on the connection between blessedness and knowledge on the one hand, and knowledge and power on the other. Accordingly, the point is that we do not acquire this knowledge by first controlling our lusts, but that we have the power to control them (virtue) only to the extent to which we already possess adequate knowledge. And it is in this knowledge, also characterized as peace of mind, that blessedness consists.

13 Politics

Spinoza's concern with political theory has its philosophical roots in his conception of human beings as social animals, which entails the necessity of living in a state under a system of laws; but it was also triggered by the political situation in his own time. In the Netherlands, the monarchist party was intent on overthrowing the republican form of government, and their allies, the Reformed clergy, desired to establish a state church. In spite of his

commitment to a life of philosophical contemplation, Spinoza was keenly aware of this situation and the dangers it posed to freedom of thought and expression, which he regarded as essential. His philosophical response to this threat, as well as the statement of his own views about the nature and function of the state, are to be found in the *Tractatus Theologico-politicus* (*Theological-Political Treatise*) and the *Tractatus Politicus* (*Political Treatise*). The former is a polemical work, intended, at least in part, as a response to the Reformed clergy, while the latter is a dispassionate essay in political science. But despite this difference in tone and some disagreement on substantive matters, both works argue for freedom as the supreme political value and both investigate the conditions under which it can be realized and preserved.

Spinoza's political thought is best approached by way of a comparison with Hobbes. Both thinkers view human beings as thoroughly determined parts of nature and as driven by the desire for self-preservation; both are amoralists in the sense that they hold that everyone has a 'natural right' to do whatever is deemed necessary for self-preservation; as a direct consequence of this view of natural right, both view the state of nature (the pre-political condition) as one of unavoidable conflict and insecurity; and, finally, both maintain that peace and security can be attained only if everyone surrenders all of their natural right to a sovereign power (which takes the form of a social contract). But whereas Hobbes concludes from his account the necessity of an absolute sovereign power, preferably in the form of a monarchy, Spinoza infers from substantially the same premises that the true end of the state is freedom, and, at least in the *Theological-Political Treatise*, that democracy is 'the most natural form of state'.

To some extent, these differences can be understood in terms of the different social and political conditions under which the two thinkers lived. There are also important philosophical differences, however, one of which is their respective conceptions of human reason. For Hobbes, reason has a merely instrumental value as a means to the attainment of ends dictated by desire. We have seen, however, that for Spinoza the goal is to transform desire through reason, which naturally leads him to focus on the conditions under which the life of reason can best be lived. Moreover, Spinoza seems to have arrived at his conclusions through a kind of internal critique of Hobbes. As he informed a correspondent in 1674:

> With regard to politics, the difference between Hobbes and me . . . consists in this, that I ever preserve the natural right intact so that the supreme power in a state has no more right over a subject than is proportionate to the power by which it is superior to the subject. This is what always takes place in the state of nature.
>
> (*The Correspondence of Spinoza* 1966 letter 50: 269)

By suggesting that Hobbes did not keep natural right intact, Spinoza is implying that he did not consistently equate right with power. This is indeed true; but it does not explain how the identification of might with right enables Spinoza to arrive at his conclusions. The gist of the answer, as suggested by this passage, is that the identification applies also to sovereign power. In other words, rather than gaining absolute right over its subjects through the social contract, as Hobbes maintained, the sovereign's right is limited by its power; and since this power is inevitably limited, so too are the things that a sovereign may 'legitimately' demand of its subjects.

Among the things that a sovereign cannot require are acts so contrary to human nature that no threat or promise could lead a person to perform them. These include things such as forcing people to testify against themselves or to make no effort to avoid death. But Spinoza does not stop at such obvious cases. He also emphasizes the limitation of legislative power with respect to private morality; and he finds an argument for freedom of thought in the fact that a government is powerless to prevent it. More importantly, he points out that there are some things which a government can do by brute force, but in doing so inevitably undermines its own authority. And since a government cannot do these things with impunity, it does not have the 'right' to do them at all. Thus, he argues on entirely pragmatic grounds for the limitation of governmental power through the power of public opinion.

Spinoza's main concern as political theorist, however, is not to determine what the state cannot do, but rather what it should do in order to realize the end for which it was established. Moreover, while verbally agreeing with Hobbes in construing this end as peace and security, Spinoza understands these in a much broader sense. Accordingly, peace is not merely an absence of war or the threat thereof, but a positive condition in which people can exercise their virtue. Thus, the goal of the state is to create this condition, which is also the social condition necessary for the life of reason as depicted in the *Ethics*.

But the life of reason is only for the few, and political arrangements must concern the many. Moreover, since it is the many who determine the public opinion to which the government must pay

heed if it is to rule effectively, it follows that there can be valid laws, approved at least tacitly by a majority, which are none the less inimical to true virtue. Spinoza was keenly aware of this problem; but his way of dealing with it indicates the tension between his democratic tendencies and his elitism that runs throughout his theory. Thus on the one hand he insists on the right of free expression, including the right to protest against laws deemed unjust, while on the other hand he emphasizes the necessity of total obedience to the existing law, no matter how contrary to reason it may be. The reason for this conservative turn, which is also reflected in the complete rejection of revolution as a political remedy, lies in his profound sense of the irrationality of the multitude. Given this irrationality, which poses a constant threat to the power of reason, Spinoza concludes with Hobbes that even under a tyrannical regime, obedience to the established authority is the lesser evil.

14 Scripture

Spinoza's revolutionary treatment of the Bible in the *Theological-Political Treatise* must also be understood within the framework of his political thought. In line with his concern to secure the freedom to philosophize, he launches a systematic attack on the authority of Scripture: its claim to be the revealed word of God. But rather than offering an external philosophical critique in the manner of the *Ethics*, he attempts, in a somewhat paradoxical fashion, to show from Scripture itself that it makes no such claim to authority. This strategy, in turn, rests on a new method of Biblical exegesis, one based on the Cartesian principle that nothing should be attributed to the text that is not clearly and distinctly perceived to be contained in it. In light of this principle, he rejects both the Calvinist doctrine that a supernatural faculty is required for interpreting the Bible and the older Jewish rationalism of Maimonides, which held that if the literal reading of a passage conflicts with reason, it must be interpreted in some metaphorical sense (see MAIMONIDES, M.). Both of these approaches he regards as not only useless for interpreting the Bible, but as dangerous politically, since they lead to the establishment of spiritual authorities.

Applying his method, Spinoza argues that neither prophecy nor miracles, the twin pillars of biblical authority, are able to support the orthodox claims. The prophets are shown to differ from other individuals in their superior imaginations, not in their intellects. Similarly, biblical miracles are treated as natural occurrences, which only appeared mysterious to the biblical authors because of their limited understandings and, as such, have no probative value. More generally, the Bible is viewed as a document which reflects the limited understandings of a crude people rather than the dictates of an omniscient deity. And by analysing Scripture in this way, Spinoza laid the foundation for the subsequent historical study of the Bible ('higher criticism'), which endeavours to interpret it by the same methods applicable to any other ancient text.

Spinoza's critique of the Bible is, however, largely directed against its speculative content and claim to be a source of theoretical truth. Thus, he affirms that in moral matters the Bible has a consistent and true teaching, which reduces essentially to the requirement to love one's neighbour. Moreover, precisely because it appeals to the imagination rather than the intellect, it has the great virtue of presenting morality in a form which the multitude can grasp. Such a view of religion as morality for the masses is hardly original to Spinoza. It had already been expressed in the twelfth century by Averroes (see IBN RUSHD), and it found expression in many subsequent politically minded thinkers, including MACHIAVELLI. But, if not original to Spinoza, it is still an integral part of his political thought, since it enables him to 'save' religion while also protecting the autonomy of philosophy. And the latter is, of course, necessary for the life of reason as depicted in the *Ethics*.

STATE, THE

States are inescapable, powerful and fundamentally important in the modern world. They spend a substantial portion of their members' wealth; they tax, confiscate or compulsorily purchase private property; conscript; impose punishments, including capital punishment; defend their members from aggression and protect their rights; and provide educational, health and other essential social services.

States are also central to modern political philosophy, and figure in its main topics. For instance, the various theories of social justice concern which principle or principles of justice should be followed by states. Again, discussions of the rights of individuals, or of groups, presuppose states to make the preferred rights effective. The answers to traditional questions, such as whether one is morally obliged to obey the laws of a state, or whether freedom is reduced by the state or made possible by it, must depend in part on what a state is taken to be.

The principal features of the modern state are basically agreed upon (population, territory, effective and legitimate government, independence). But there are underlying assumptions needing notice, and many questions about the state, especially concerning its proper activities, are controversial and disputed. Moreover, the value of the state can be challenged, and its future doubted, especially in the light of increasing economic and political globalization and moral cosmopolitanism.

STATISTICS

The discipline of statistics encompasses an extremely broad and heterogeneous set of problems and techniques. These include problems of statistical inference, which have to do with inferring from a body of sample data (for example, the observed results of tossing a coin or of drawing a number of balls at random from an urn containing balls of different colours) to some feature of the underlying distribution from which the sample is drawn (for example, the probability of heads when the coin is tossed, or the relative proportion of red balls in the urn).

There are two conflicting approaches to the foundations of statistical inference. The classical tradition derives from ideas of Ronald Fisher, Jerzy Neyman and Egon Pearson and embodies the standard treatments of hypothesis testing, confidence intervals and estimation found in many statistics textbooks. Classicists adopt a relative-frequency conception of probability and, except in special circumstances, eschew the assignment of probabilities to hypotheses, seeking instead a rationale for statistical inference in facts about the error characteristics of testing procedures. By contrast, the Bayesian tradition, so-called because of the central role it assigns to Bayes' theorem, adopts a subjective or degree-of-belief conception of probability and represents the upshot of a statistical inference as a claim about how probable a statistical hypothesis is in the light of the evidence.

STATISTICS AND SOCIAL SCIENCE

There are a number of distinct uses for statistics in the social sciences. One use is simply to provide a summary description of complicated features in a population.

A second use of statistics is to predict (some) features of a unit or group in a population, given other features of the unit or group. For example, a company may charge lower health insurance rates for people who do not smoke, because smokers have a lower risk of lung cancer. Some companies could also charge lower health insurance rates for people who do not have a heavy cough, because the probability of having lung cancer is lower for such people. Predictions can be made by developing a probabilistic model of the joint distribution of incidence of smoking, lung cancer, and incidence of heavy coughs in the population.

A third use of statistics is to help predict the probable effects of adopting different policies. For example, the government may consider a number of alternative policies for reducing the rate of lung cancer. One policy would ban smoking. Another policy would make everyone who coughs take cough medicine. Both smoking and coughing are predictors of lung cancer. But because smoking is a cause of lung cancer, while coughing is an effect of lung cancer, the first policy seems as if it might achieve the desired effect, while the second does not. In order to answer policy questions we need to know not only how the variables are distributed in the actual population, but also how they are causally related. A causal model specifies the causal relations between features in a population, as well as specifying a probability distribution of the features. Statistical information together with causal information can be used to predict the effects of adopting a certain policy.

A fourth use of statistics is in helping decide which policies should be adopted in order to achieve specific goals. Such decisions are based not only on the probable effects of each policy, but also on assigning different utilities to each possible outcome. This use of statistics is a branch of decision theory.

STEWART, DUGALD (1753–1828)

Dugald Stewart was, after Thomas Reid, the most influential figure of the Common Sense School; he was a major influence on Victor Cousin and Théodore Jouffroy in France and on most academic philosophers in the United States. Along with Reid and Cousin, Stewart made the Scottish tradition the dominant philosophy in America for half a century. His *Elements of the Philosophy of the Human Mind* and *Philosophy of the Active and Moral Powers of Man* were his most important works and went through a number of printings. The abridged edition of his *Active and Moral Powers* was reprinted ten times from 1849 to 1868.

Stewart followed Reid in claiming that any philosophy which contravenes the principles of common sense must be false, and the problem is to discover and eliminate the premise which yields such results. He added the requirement that philosophical propositions must not change the *meanings* of concepts in ordinary life, and he also added a new dimension to Reid's agency theory. More than any other writer he emphasized correctly the epistemic similarities between Reid and Immanuel Kant, but he followed Reid in avoiding Kant's distinction between phenomena and noumena.

Stewart disagreed with Reid in avoiding the phrase 'principles of common sense' as misleading, rejected his mentor's realistic interpretation of universals and provided his own nominalistic alternative. He also modified to some extent, though quite cautiously, Reid's rigid inductivism and made some concessions to a realistic interpretation of scientific hypotheses. Stewart was equipped to discuss issues in the philosophy of science since he was well versed in mathematics and physics, having been professor of mathematics at Edinburgh for ten years before being named professor of moral philosophy. Stewart was arguably the first and finest philosopher of science in the Scottish tradition.

STIRNER, MAX (1806–56)

Max Stirner is the author of *Der Einzige und sein Eigentum* (*The Ego and Its Own*), first published in Germany in 1844 and best known for its idiosyncrasies of argument and idiom. Stirner condemns modernity as entrenched in religious modes of thought and envisages a positive egoistic future in which individuals are liberated from the tyranny of those ideas and social arrangements which restrict autonomy. *The Ego and Its Own* was an impulse to the decline of the Hegelian left as a coherent intellectual movement, and played an important role in the genesis of Marxism; Stirner has also been variously portrayed as a precursor of Nietzsche, an individualist anarchist and a forerunner of existentialism.

DAVID LEOPOLD

STOICISM

Stoicism is the Greek philosophical system founded by Zeno of Citium *c*.300 BC and developed by him and his successors into the most influential philosophy of the Hellenistic age. It views the world as permeated by rationality and divinely planned as the best possible organization of matter. Moral goodness and happiness are achieved, if at all, by replicating that perfect rationality in oneself, and by finding out and enacting one's own assigned role in the cosmic scheme of things.

The leading figures in classical, or early, Stoicism are the school's first three heads: Zeno of Citium, Cleanthes and Chrysippus. It is above all the brilliant and indefatigable Chrysippus who can be credited with building Stoicism up into a truly comprehensive system. 'Early Stoicism', discussed here, is in effect largely identical with his philosophy.

No formal philosophical writings of the early Stoics survives intact. We are mainly dependent on isolated quotations and secondary reports, many of them hostile. Nevertheless, the system has been reconstructed in great detail, and, despite gaps and uncertainties, it does live up to its own self-description as a unified whole. It is divided into three main parts: physics, logic and ethics.

The world is an ideally good organism, whose own rational soul governs it for the best. Any impression of imperfection arises from misleadingly viewing its parts (including ourselves) in isolation, as if one were to consider the interests of the foot in isolation from the needs of the whole body. The entire sequence of cosmic events is pre-ordained in every detail. Being the best possible sequence, it is repeated identically from one world phase to the next, with each phase ending in a conflagration followed by cosmic renewal. The causal nexus of 'fate' does not, however, pre-empt our individual

responsibility for our actions. These remain 'in our power', because we, rather than external circumstances, are their principal causes, and in some appropriate sense it is 'possible' for us to do otherwise, even though it is predetermined that we will not.

At the lowest level of physical analysis, the world and its contents consist of two coextensive principles: passive 'matter' and active 'god'. At the lowest observable level, however, these are already constituted into the four elements earth, water, air and fire. Air and fire form an active and pervasive life force called *pneuma* or 'breath', which constitutes the qualities of all bodies and, in an especially rarefied form, serves as the souls of living things.

'Being' is a property of bodies alone, but most things are analysed as bodies – even moral qualities, sounds, seasons and so forth – since only bodies can causally interact. For example, justice is the soul in a certain condition, the soul itself being *pneuma* and hence a body. A scheme of four ontological categories is used to aid this kind of analysis. In addition, four incorporeals are acknowledged: place, void, time and the *lekton* (roughly, the expressed content of a sentence or predicate). Universals are sidelined as fictional thought constructs, albeit rather useful ones.

The world is a physical continuum, infinitely divisible and unpunctuated by any void, although surrounded by an infinite void. Its perfect rationality, and hence the existence of an immanent god, are defended by various versions of the Argument from Design, with apparent imperfections explained away, for example, as blessings in disguise or unavoidable concomitants of the best possible structure.

'Logic' includes not only dialectic, which is the science of argument and hence logic in its modern sense, but also theory of knowledge, as well as primarily linguistic disciplines like rhetoric and grammar. Stoic inferential logic takes as its basic units not individual terms, as in Aristotelian logic, but whole propositions. Simple propositions are classified into types, and organized into complex propositions (for example, conditionals) and complete arguments. All arguments conform to, or are reducible to, five basic 'indemonstrable' argument formats. The study of logical puzzles is another central area of Stoic research.

The Stoics doggedly defended, against attacks from the sceptical Academy, the conviction that cognitive certainty is achieved through ordinary sensory encounters, provided an entirely clear impression (*phantasia*) is attained. This, the 'cognitive impression' (*phantasia katalēptikē*), is one of such a nature that the information it conveys could not be false. These self-certifying impressions, along with the natural 'preconceptions' (*prolēpseis*) which constitute human reason, are criteria of truth, on which fully scientific knowledge (*epistēmē*) – possessed only by the wise – can eventually be built.

Stoic ethics starts from *oikeiōsis*, our natural 'appropriation' first of ourselves and later of those around us, which makes other-concern integral to human nature. Certain conventionally prized items, like honour and health, are commended by nature and should be sought, but not for their own sake. They are instrumentally preferable, because learning to choose rationally between them is a step towards the eventual goal of 'living in agreement with nature'. It is the coherence of one's choices, not the attainment of their objects, that matters. The patterns of action which promote such a life were systematically codified as *kathēkonta*, 'proper functions'.

Virtue and vice are intellectual states. Vice is founded on 'passions': these are at root false value judgments, in which we lose rational control by overvaluing things which are in fact indifferent. Virtue, a set of sciences governing moral choice, is the one thing of intrinsic worth and therefore genuinely 'good'. The wise are not only the sole possessors of virtue and happiness, but also, paradoxically, of the things people conventionally value – beauty, freedom, power, and so on. However geographically scattered, the wise form a true community or 'city', governed by natural law.

The school's later phases are the 'middle Stoicism' of Panaetius and Posidonius (second to first century BC) and the 'Roman' period (first to second century AD) represented for us by the predominantly ethical writings of Seneca, Epictetus and Marcus Aurelius.

DAVID SEDLEY

STRAWSON, PETER FREDERICK (1919–)

Strawson taught at the University of Oxford from 1947, becoming Waynflete Professor of Metaphysical Philosophy in 1968, and retiring in 1987. A sequence of influential books and articles established him as one of the leading philosophers in Oxford during that period. He had a crucial role in the transition there from the dominance of Austin and linguistic philosophy in the 1950s to the more liberal and metaphysical approaches in the 1960s and later. The principal topics about which he has written are the philosophy of language, metaphysics, epistemology and the history of philosophy.

Strawson became famous with 'On Referring' (1950), in which he criticized Russell for

misconstruing our ordinary use of definite descriptions. Strawson endorses the slogan 'ordinary language has no exact logic', a viewpoint which is explored in *Introduction to Logical Theory* (1952). He argues that the utility of formal logic in its application to ordinary speech does not imply that the meaning of ordinary language is captured by the semantics of standard formal systems.

In *Individuals* (1959), Strawson's most discussed work, his task is descriptive metaphysics. He attempts to describe the referentially basic subject matter of our thought. They are relatively enduring, perceptible and re-identifiable bodies. The other element in the basic framework is what Strawson calls persons, enduring entities with both material and psychological features. In *The Bounds of Sense* (1966), Strawson continued the development of his metaphysical and epistemological ideas, by combining a critical study of Kant's *Critique of Pure Reason*, with the defence of some transcendental claims similar to Kant's. To think of oneself as an enduring subject of experience requires that one recognize objects which are independent of oneself. So the major epistemological problem in the empiricist tradition, of building up to the external world from private experiences, cannot arise.

Skepticism and Naturalism; Some Varieties (1985) studies the conflicts between fundamental opinions which are natural to us, such as that we know things, and philosophical viewpoints claiming that these opinions are mistaken. Strawson argues that scepticism about these natural views can and should be resisted. Throughout his career, Strawson has tried to describe the basic content of our thoughts and experiences, to counter scepticism about or revisions of such thoughts, to illuminate them by making analytical connections between their basic elements, as well as investigating language, our vehicle for expressing these thoughts. He has linked his explorations to the insights of philosophers of the past, while engaging in critical debate with the period's other leading philosophers, such as Austin, Quine, Davidson and Dummett.

PAUL F. SNOWDON

STRUCTURALISM

The term 'structuralism' can be applied to any analysis that emphasizes structures and relations, but it usually designates a twentieth-century European (especially French) school of thought that applies the methods of structural linguistics to the study of social and cultural phenomena. Starting from the insight that social and cultural phenomena are not physical objects and events but objects and events with meaning, and that their signification must therefore be a focus of analysis, structuralists reject causal analysis and any attempt to explain social and cultural phenomena one-by-one. Rather, they focus on the internal structure of cultural objects and, more importantly, the underlying structures that make them possible. To investigate neckties, for instance, structuralism would attempt to reconstruct (1) the internal structure of neckties (the oppositions – wide/narrow, loud/subdued – that enable different sorts of neckties to bear different meanings for members of a culture) and (2) the underlying 'vestimentary' structures or system of a given culture (how do neckties relate to other items of clothing and the wearing of neckties to other socially-coded actions).

Ferdinand de Saussure, the founder of structural linguistics, insists that to study language, analysts must describe a linguistic system, which consists of structures, not substance. The physical sound of a word or sign is irrelevant to its linguistic function: what counts are the relations, the contrasts, that differentiate signs. Thus in Morse code a beginner's dot may be longer than an expert's dash: the structural relation, the distinction, between dot and dash is what matters.

For structuralism, the crucial point is that the object of analysis is not the corpus of utterances linguists might collect, that which Saussure identifies as *parole* (speech), but the underlying system (*la langue*), a set of formal elements defined in relation to each other and which can be variously combined to form sentences. Arguing that the analysis of systems of relation is the appropriate way to study human phenomena, that our world consists not of things but of relations, structuralists often claim to provide a new paradigm for the human sciences. In France, structuralism displaced existentialism in the 1960s as a public philosophical movement. Philosophically, proponents of structuralism have been concerned to distinguish it from phenomenology.

See also: Structuralism in linguistics; Structuralism in social science

JONATHAN CULLER

STRUCTURALISM IN LINGUISTICS

The term structural linguistics can be used to refer to two movements which developed independently of each other. The first is European and can be characterized as post-Saussurean, since Saussure is generally regarded as its inspiration. The central claim of this movement is that terms of a language of all kinds (sounds, words, meanings) present themselves in Saussure's phrase 'as a system', and can only be identified by describing their relations

to other terms of the same language; one cannot first identify the terms of a language and then ask which system they belong to. Moreover, because a language is a system of signs, one cannot identify expression-elements (sounds, words) independently of the content-elements (meanings), so that a study of language cannot be divorced from one of meaning. The second movement is an American one, which developed from the work of Leonard Bloomfield and dominated American linguistics in the 1940s and 1950s. It attached great importance to methodological rigour and, influenced by behaviourist psychology, was hostile to mentalism (any theory which posits an independent category of mental events and processes). As a result, unlike the first movement, it excluded the study of meaning from that of grammar, and tried to develop a methodology to describe any corpus in terms of the distribution of its expression-elements relative to each other. Whereas the first movement provided a model for structuralist thought in general, and had a significant impact on such thinkers as Barthes, Lacan and Lévi-Strauss, the second made a major contribution to the development of formal models of language, however inadequate they may seem now in the light of Chomsky's criticisms.

DAVID HOLDCROFT

STRUCTURALISM IN SOCIAL SCIENCE

Any school of thought in the social sciences that stresses the priority of order over action is 'structural'. In the twentieth century, however, 'structuralism' has been used to denote a European, largely French language, school of thought that applied methods and conceptions of order developed in structural linguistics to a wide variety of cultural and social phenomena. Structuralism aspired to be a scientific approach to language and social phenomena that, in conceiving of them as governed by autonomous law-governed structures, minimized consideration of social-historical context and individual as well as collective action. Structural linguistics was developed in the early part of the twentieth century primarily by the Swiss linguist, Ferdinand de Saussure. After the Second World War, it fostered roughly three phases of structural approaches to social phenomena. Under the lead of above all the French anthropologist Claude Lévi-Strauss, classical structuralism applied structural linguistic conceptions of structure with relatively little transformation to such social phenomena as kinship structures, myths, cooking practices, religion and ideology. At the same time, the French psychoanalyst Jacques Lacan appropriated Saussure's conceptual apparatus to retheorize the Freudian unconscious. In the 1960s, a second phase of structural thought, neo-structuralism, extended structural linguistic notions of order to a fuller spectrum of social phenomena, including knowledge, politics and society as a whole. Many of Saussure's trademark conceptions were abandoned, however, during this phase. Since the 1970s, a third phase of structuralism has advanced general theories of social life that centre on how structures govern action. In so refocusing structural theory, however, the new structuralists have broken with the conception of structure that heretofore reigned in structural thought.

THEODORE R. SCHATZKI

SUÁREZ, FRANCISCO (1548–1617)

Francisco Suárez was the main channel through which medieval philosophy flowed into the modern world. He was educated first in law and, after his entry into the Jesuits, in philosophy and theology. He wrote on all three subjects. His philosophical writing was principally in the areas of metaphysics, psychology and philosophy of law, but in both his philosophical and theological works he treated many related epistemological, cosmological and ethical issues. While his basic outlook is that of a very independent Thomist, his metaphysics follows along a line earlier drawn by Avicenna (980–1037) and Duns Scotus (1266–1308) to treat as its subject 'being in so far as it is real being'. By the addition of the word 'real' to Aristotle's formula, Suárez emphasized Aristotle's division of being into categorial being and 'being as true', as well as Aristotle's exclusion of the latter from the object of metaphysics. Divided into a general part dealing with the concept of being as such, its properties and causes, and a second part which considers particular beings (God and creatures) in addition to the categories of being, Suárez's metaphysics ends with a notable treatment of mind-dependent beings, or 'beings of reason'. These last encompass negations, privations and relations of reason, but Suárez's treatment centres on those negations which are 'impossible' or self-contradictory. Inasmuch as such beings of reason cannot exist outside the mind, they are excluded from the object of metaphysics and relegated to the status of 'being as true'. In philosophy of law he was a proponent of natural law and of a theory of government in which power comes from God through the people. He was important for the early development of modern international law and the doctrine of just war. While his brand of Thomism was opposed in his

own time and after by some scholastics, especially Dominicans, he had great authority among his fellow Jesuits, as well as other Catholic and Protestant authors. Outside scholasticism, he has influenced a variety of modern thinkers.

SUBLIME, THE

The origin of the term 'the sublime' is found in ancient philosophy, where, for example, Longinus linked it with a lofty and elevated use of literary language. In the eighteenth century, the term came into much broader use, when it was applied not only to literature but also to the experience of nature, whereafter it became one of the most hotly debated subjects in the cultural discourse of that age.

The theories of Addison, Burke and Kant are especially significant. Addison developed and extended the Longinian view of the sublime as a mode of elevated self-transcendence, while Burke extended John Dennis' insight concerning sublimity's connection with terror and a sense of self-preservation. While Addison and Burke encompassed both art and nature in their approaches, Kant confined the experience of the sublime to our encounters with nature. In his theory, the sublime is defined as a pleasure in the way that nature's capacity to overwhelm our powers of perception and imagination is contained by and serves to vivify our powers of rational comprehension. It is a distinctive aesthetic experience.

In the 1980s and 1990s Kant's and (to a much lesser extent) Burke's theories of the sublime became the objects of a massive revival of interest, in the immediate context of a more general discussion of postmodern society. Kant's theory, for example, has been used by J.-F. Lyotard and others to explain the sensibility – orientated towards the enjoyment of complexity, rapid change and a breakdown of categories – that seems to characterize that society.

PAUL CROWTHER

SUBSTANCE

For Aristotle, 'substances' are the things which exist in their own right, both the logically ultimate subjects of predication and the ultimate objects of scientific inquiry. They are the unified material objects, as well as the natural stuffs, identifiable in sense-experience, each taken to be a member of a natural species with its 'form' and functional essence. Entities in other categories – qualities, actions, relations and so forth – are treated as dependent on, if not just abstracted aspects of, these independent realities.

With the rise of mechanistic physics in the seventeenth century, the Aristotelian multiplicity of substances was reduced to universal matter mechanically differentiated. This move sharpened the issue of the relation of mind to the physical world. The consequent variety of ways in which the notion of substance was manipulated by materialists, dualists, immaterialists and anti-dogmatists encouraged later scepticism about the distinction between independent realities and human abstractions, and so idealism.

Twentieth-century conceptualism, like some earlier versions of idealism, rejects the distinction altogether, commonly ascribing the logical priority of material things in natural language to the utility of a folk physics, as if they were the theoretical entities of everyday life. As such, their identity and existence are determined only through applications of a theory outdated by modern science. Yet this 'top-down', holistic philosophy of language is belied by the detailed insights of traditional logic, which point clearly to a 'bottom-up' account of classification and identity, that is an account which recognizes the possibility of perceptually picking out material objects prior to knowledge of their kind or nature, and of subsequently classifying them. The idea that material things are theoretical entities, and that their individuation is accordingly kind-dependent, is a hangover from an atomistic approach to perception which calls on theory to tie sensory information together. A more accurate understanding of sensation as the already integrated presentation of bodies in spatial relations to one another and to the perceiver is consonant with the possibility denied by the idealist– namely, that, with respect to its primitive referents, language and

thought are shaped around reality itself, the independent objects given in active sense-experience. That the coherence or discrete unity of material objects has a physical explanation does not mean that physics explains it away.

SUFISM

See al-Ghazali, Abu Hamid

SUICIDE, ETHICS OF

Suicide has been condemned as necessarily immoral by most Western religions and also by many philosophers. It is argued that suicide defies the will of God, that it is socially harmful and that it is opposed to 'nature'. According to Kant, those who commit suicide 'degrade' humanity by treating themselves as things rather than as persons; furthermore, since they are the subject of moral acts, they 'root out' morality by removing themselves from the scene.

In opposition to this tradition the Stoics and the philosophers of the Enlightenment maintained that there is nothing necessarily immoral about suicide. It is sometimes unwise, causing needless suffering, but it is frequently entirely rational and occasionally even heroic. Judging by the reforms in laws against suicide and the reactions to the suicides of prominent persons in recent decades, it appears that the Enlightenment position is becoming very generally accepted.

PAUL EDWARDS

SUPEREROGATION

Supererogatory actions are usually characterized as 'actions above and beyond the call of duty'. Historically, Catholic thinkers defended the doctrine of supererogation by distinguishing what God commands from what he merely prefers, while Reformation thinkers claimed that all actions willed by God are obligatory. In contemporary philosophy, it is often argued that if morality is to permit us to pursue our own personal interests, it must recognize that many self-sacrificing altruistic acts are supererogatory rather than obligatory. The need for some category of the supererogatory is particularly urgent if moral obligations are thought of as rationally overriding. There are three main contemporary approaches to defining the supererogatory. The first locates the obligatory/supererogatory distinction within positive social morality, holding that the former are actions we are blameworthy for failing to perform, while the latter are actions we may refrain from performing without blame. The second holds that obligatory actions are supported by morally conclusive reasons, while supererogatory actions are not. On this approach the personal sacrifice sometimes involved in acting altruistically counts against it from the moral point of view, making some altruistic actions supererogatory rather than obligatory. The third approach appeals to virtue and vice, holding that obligatory actions are those failures to perform which reveal some defect in the agent's character, while supererogatory actions are those that may be omitted without vice.

GREGORY VELAZCO Y TRIANOSKY

SUPERVENIENCE

Supervenience is used of the relationship between two kinds of properties that things may have. It refers to the way in which one kind of property may only be present in virtue of the presence of some other kind: a thing can only possess a property of the first, supervening kind because it has properties of the underlying kind, but once the underlying kind is fixed, then the properties of the first kind are fixed as well. The supervening features exist only because of the underlying, or 'subjacent' properties, and these are sufficient to determine how the supervening features come out. For example, a person can only be good in virtue of being kind, or generous, or possessing some other personal qualities, and an animal can only be alive in virtue of possessing some kind of advanced physical organization. Equally, a painting can only represent a subject in virtue of the geometrical arrangement of light-reflecting surfaces, and its representational powers supervene on this arrangement. A melody supervenes on a sequence of notes, and the dispositions and powers of a thing may supervene on its physical constitution.

Although the word supervenience first appears in twentieth-century philosophy, the concept had previously appeared in discussion of the 'emergence' of life from underlying physical complexity. The central philosophical problem lies in understanding the relationship between the two levels. We do not want the relationship to be entirely

mysterious, as if it is just a metaphysical accident that properties of the upper level arise when things are suitably organized at the lower level. On the other hand, if the relationship becomes too close so that, for instance, it is a logical truth that once the lower-level properties are in place the upper-level ones emerge, the idea that there are two genuinely distinct levels becomes problematic: perhaps the upper-level properties are really nothing but lower-level ones differently described.

If this problem is dealt with, there may still remain difficulties in thinking about the upper-level properties. For example, can they be said to cause things, or explain things, or must these notions be reserved for the lower-level properties? Supposing that only lower-level properties really do any work leads to epiphenomenalism – the idea that the upper-level properties really play no role in determining the course of events. This seems to clash with common-sense belief in the causal powers of various properties that undoubtedly supervene on others, and also leads to a difficult search for some conception of the final, basic or lowest level of fact on which all else supervenes.

SUSTAINABILITY

Sustainability is a property of any activity, practice, process or institution that has the capacity to be continued in more or less the same way indefinitely. The concept has risen to prominence in recent years in response to the realization that continued social and economic development may not be sustainable in view of the unprecedented environmental changes that it brings about. Development is said to be sustainable, in the words of the 'Brundtland Report', when it 'meets the needs of the present without compromising the ability of future generations to meet their own needs'. This prescription is widely perceived to capture and to integrate a number of existing social and political objectives (justice, the alleviation of poverty and the protection of the environment), and following the United Nations Conference on Environment and Development held in Rio de Janeiro in 1992 it is now the declared objective of local and national governments worldwide, as well as of a large number of business and non-government organizations. Given its purported practical relevance, a great deal of intellectual effort has been concentrated upon developing a viable conception of sustainability for policy purposes. Economic and ecological models of the concept have been developed, and criticized. Recent attention has focused more on the political and institutional dimensions of the problem.

SYNTAX

Syntax (more loosely, 'grammar') is the study of the properties of expressions that distinguish them as members of different linguistic categories, and 'well-formedness', that is, the ways in which expressions belonging to these categories may be combined to form larger units. Typical syntactic categories include noun, verb and sentence. Syntactic properties have played an important role not only in the study of 'natural' languages (such as English or Urdu) but also in the study of logic and computation. For example, in symbolic logic, classes of well-formed formulas are specified without mentioning what formulas (or their parts) mean, or whether they are true or false; similarly, the operations of a computer can be fruitfully specified using only syntactic properties, a fact that has a bearing on the viability of computational theories of mind.

The study of the syntax of natural language has taken on significance for philosophy in the twentieth century, partly because of the suspicion, voiced by Russell, Wittgenstein and the logical positivists, that philosophical problems often turned on misunderstandings of syntax (or the closely related notion of 'logical form'). Moreover, an idea that has been fruitfully developed since the pioneering work of Frege is that a proper understanding of syntax offers an important basis for any understanding of semantics, since the meaning of a complex expression is compositional, that is, built up from the meanings of its parts as determined by syntax.

In the mid-twentieth century, philosophical interest in the systematic study of the syntax of natural language was heightened by Noam Chomsky's work on the nature of syntactic rules and on the innateness of mental structures specific to the acquisition (or growth) of grammatical knowledge.

This work formalized traditional work on grammatical categories within an approach to the theory of computability, and also revived proposals of traditional philosophical rationalists that many twentieth-century empiricists had regarded as bankrupt. Chomskian theories of grammar have become the focus of most contemporary work on syntax.

TANABE HAJIME (1885–1962)

Tanabe Hajime was a central figure of the so-called Kyoto School, and is generally acknowledged to be one of the most important philosophers of modern Japan. He held Kant in high esteem, and used a Neo-Kantian critical methodology in his early studies in epistemology. In the 1920s he was chiefly influenced by Nishida Kitarō's original cosmological system. He adapted Nishida's idea of 'absolute nothingness' to political situations and, in so doing, contributed much to establishing the foundations of what became the most influential philosophical school in Japan up until the end of the Second World War.

TARSKI, ALFRED (1901–83)

Alfred Tarski was a Polish mathematician and logician. He worked in metamathematics and semantics, set theory, algebra and the foundations of geometry. Some of his logical works, in particular his definition of truth, were also significant contributions to philosophy. He was a successful teacher and a master of writing simply and with great clarity about complicated matters.

ROMAN MURAWSKI

TAXONOMY

The fundamental elements of any classification are its theoretical commitments, basic units and the criteria for ordering these basic units into a classification. Two fundamentally different sorts of classification are those that reflect structural organization and those that are systematically related to historical development.

In biological classification, evolution supplies the theoretical orientation. The goal is to make the basic units of classification (taxonomic species) identical to the basic units of biological evolution (evolutionary species). The principle of order is supplied by phylogeny. Species splitting successively through time produce a phylogenetic tree. The primary goal of taxonomy since Darwin has been to reflect these successive splittings in a hierarchical classification made up of species, genera, families, and so on.

The major point of contention in taxonomy is epistemological. A recurrent complaint against classifications that attempt to reflect phylogeny is that phylogeny cannot be 'known' with certainty sufficient to warrant using it as the object of classification. Instead, small but persistent groups of taxonomists have insisted that classifications be more 'operational'. Instead of attempting to reflect something as difficult to infer as phylogeny, advocates of this position contend that systematists should stick more closely to observational reality.

DAVID L. HULL

TAYLOR, CHARLES (1931–)

Among the most influential of late twentieth-century philosophers, Taylor has written on human agency, identity and the self; language; the limits of epistemology; interpretation and explanation in social science; ethics; and democratic politics. His work is distinctive because of his innovative treatments of long-standing philosophical problems, especially those deriving from applications of

Enlightenment epistemology to theories of language, the self and political action, and his unusually thorough integration of 'analytic' and 'Continental' philosophical concerns and approaches.

Taylor's work is shaped by the view that adequate understanding of philosophical arguments requires an appreciation of their origins, changing contexts and transformed meanings. Thus it often takes the form of historical reconstructions that seek to identify the paths by which particular theories and languages of understanding or evaluation have been developed. This reflects both Taylor's sustained engagement with Hegel's philosophy and his resistance to epistemological dichotomies such as 'truth' and 'falsehood' in favour of a notion of 'epistemic gain' influenced by H.G. Gadamer.

CRAIG CALHOUN

TECHNĒ

Technē (plural *technai*) is the ancient Greek term for an art or craft; examples include carpentry, sculpting and medicine. Philosophical interest in the *technai* stems from their use as a model and metaphor for all aspects of practical rationality, including its perfection in philosophy (the 'art of living'). From Socrates onwards, the notion of *technē* is employed for thinking about the connections between reason, ends and action. *Technai* are held to possess epistemological virtues (such as coherence and explanatory power) and practical virtues (their delivering of detailed instructions for action) against which other bodies of belief or practical systems can be studied and judged.

TAD BRENNAN

TECHNOLOGY AND ETHICS

Only within the modern period have philosophers made a direct and sustained study of ethics and technology. Their work follows two philosophical traditions, each marked by distinct styles: the Continental or phenomenological tradition, and the Anglo-American or analytical tradition.

Hans Jonas articulated one of the basic premises of Continental approaches when he argued for technology as a special subject of ethics: because technology has fundamentally transformed the human condition, generating problems of global magnitude extending into the indefinite future, it calls for a new approach to ethics. Jonas' basic premise is expressed variously in the works of Karl Marx, Max Scheler, José Ortega y Gasset, Martin Heidegger and others.

Work within the Anglo-American tradition tends not to deal with technology as a whole but to be organized around particular technologies, such as computing, engineering, and medical and biological sciences. It draws on concepts and principles of traditional ethical theory at least as a starting point for analyses. Although each of the technologies has a unique set of problems, certain themes, such as responsibility, risk, equity and autonomy, are common to almost all.

Social scientists have also raised important issues for the field of ethics and technology. Their work has yielded two dominant schools of thought: technological determinism and social constructivism.

CARL MITCHAM
HELEN NISSENBAUM

TECHNOLOGY, PHILOSOPHY OF

The philosophy of technology deals with the nature of technology and its effects on human life and society. The increasing influence of modern technology on human existence has triggered a growing interest in a philosophical analysis of technology. Nevertheless, the philosophy of technology as a coherent field of research does not yet exist. The subject covers studies from almost every branch of thinking in philosophy and deals with a great variety of topics because of a lack of consensus about the primary meaning of the term 'technology', which may, among others, refer to a collection of artefacts, a form of human action, a form of knowledge or a social process.

Among the most fundamental issues are two demarcation problems directly related to the definition of technology. The first concerns the distinction between technological (artificial) and natural objects. It involves the relation between man, nature and culture. The second pertains to the distinction between science and technology as types of knowledge. The science–technology relationship has become of central importance because of the widespread assumption that the distinguishing feature of modern technology, as compared to traditional forms of technology, is that it is science-based. Another much discussed issue is the autonomy of technology. It deals with the question of whether technology follows its own inevitable course of development, irrespective of its social, political, economic and cultural context.

PETER KROES

TELEOLOGICAL ARGUMENT

See God, arguments for the existence of

TELEOLOGICAL ETHICS

The Greek *telos* means final purpose; a teleological ethical theory explains and justifies ethical values by reference to some final purpose or good. Two different types of ethical theory have been called teleological, however. Ancient Greek theories are 'teleological' because they identify virtue with the perfection of human nature. Modern utilitarianism is 'teleological' because it defines right conduct as that which promotes the best consequences.

TELEOLOGY

Introduction

Teleology is the study of purposes, goals, ends and functions. Intrinsic or immanent teleology is concerned with cases of aiming or striving towards goals; extrinsic teleology covers cases where an object, event or characteristic serves a function for something.

Teleological explanations attempt to explain X by saying that X exists or occurs for the sake of Y. Since the question 'For what purpose . . . ?' may be construed either intrinsically or extrinsically, such explanations split into two broad types: those that cite goals of an agent, and those that cite functions.

The history of Western philosophy and science has been characterized by major debates about the logic, legitimacy and proper domains of these types of explanation. They still raise problems in contemporary biology and psychology. The modern debates have progressed considerably from the earlier ones, although continuities do exist.

1 Goals

Aristotle's views about the domain of striving that is present in nature were challenged during the Renaissance. Aristotle held that goals were 'final causes', that inanimate things seek natural places or states which are proper to their kind, and that growth and development in living things is directed towards the attainment of maturity.

The term 'final cause' misled some commentators, who assumed that a final cause is an efficient cause that comes after its effect. This could not have been Aristotle's view. Aristotle believed that trees grow leaves in order to protect their fruit (*Physics:* 199a, 26–9), but he recognized that the fruit is not always successfully protected. If birds eat the fruit, and hence the final cause fails to come about, this fact in no way undermines the teleological explanation. If he had meant that fruit-protection was an efficient cause working backwards in time, the failure to come about would undercut the efficient causal explanation. A final cause, for Aristotle, is a 'that for the sake of which' (see Aristotle §9).

Still, there were other objections to his explaining the movements of inorganic bodies by ascribing goals to them. Francis Bacon, Galileo and Newton eschewed such explanations on the grounds that they were entirely speculative and otiose. First, the alleged striving could not be identified independently of the changes that actually occurred to the body, nor could its goal be identified – the hypothesis was untestable. Second, the hypothesis was unnecessary, at least in the fields of mechanics and dynamics, since a complete explanation could be provided in terms of antecedent causes and the laws of motion. As Bacon put it, 'Inquiry into final causes is sterile, and, like a virgin consecrated to God, produces nothing' (*De Augmentis Scientiarum* 1623).

Modern science does not sanction the ascription of goals or strivings to inanimate objects, except possibly to such artefacts as guided missiles, autonomous robots, and mechanical searching devices, which were first designed in the 1940s. But here the goal-talk is perhaps only 'as if' (Woodfield 1976: ch. 11).

In the life sciences, however, it is accepted that human beings and animals *do* strive after goals. The conviction that we are intentional agents is central to our self-image and to society. Moreover, animal and human goals can be identified in advance of the behaviour that they explain. The hypothesis that an animal is striving for food, for example, can be tested experimentally. So it is not true that goal-explanations are *in principle* vacuous.

Whether plants strive is, perhaps, unclear. Although we speak as if they did ('The flower turned in order to face the sun' and so on), such locutions may be merely a hangover from an Aristotelian tradition. They survive because we find them picturesque or convenient. In late-twentieth-century biology, vitalistic teleological theories of growth and development are not thought to be respectable, even though such processes cannot quite be explained in wholly physico-chemical terms (see Vitalism).

Are goal-explanations restricted, then, to the domain of intentional behaviour performed by intelligent organisms? The central case is surely that of the animate agent, conscious of what it wants, sensitive to information about its environment and able to represent alternative plans to itself. If goals always involve desires, beliefs and other mental states, then intrinsic teleological explanations are a species of mentalistic explanation. The main problem that arises next is to provide a satisfactory account of intentionality (see INTENTIONALITY).

Several philosophers in the twentieth century have tried to make room for a distinctive form of goal-explanation which is not necessarily mentalistic (see, for example, Wright 1976). Such theories may be viewed as broadly Aristotelian in the sense that they locate striving in activity which exhibits a distinctive pattern or causal structure.

2 Functions

Aristotle maintained that if an item *X* is a part of a system *S* in which *X* performs a characteristic activity that benefits *S*, then *X* exists and acts for the sake of *S*. *S* might be a living organism or something bigger, such as a bee-colony, an ecosystem or even the world as a whole. The fact that *X* serves a function for *S* is supposed to explain why *X* is present in *S*. Aristotle's doctrine was naturalistic in the sense that it did not postulate a supernatural designer, but it was not wholly naturalistic, since it employed the notion of *benefiting*. The main problem with extrinsic teleological explanations in biology is to see precisely how they work.

Even supposing that it is a 'fact' that *X* does good to a bigger system *S*, that fact alone is insufficient to account for *X*'s existence. Some additional premise or principle seems to be required. For example, if nature had been designed and created by a benevolent and omnipotent God, the existence of *X* in *S* would be explicable in terms of God's wishes, beliefs and creative acts. This form of functional explanation has a familiar logic: we use such explanations when giving the reasoning that leads human beings to design and produce useful artefacts. By supplementing the explanation in this way, we present extrinsic teleology as being derivative upon the intrinsic teleology of the designer (see GOD, ARGUMENTS FOR THE EXISTENCE OF §4). This solution is unsatisfactory, however, since neither biologists nor laypeople feel that the validity of 'natural function' explanations is dependent upon any theological assumptions. Either the explanations have some other form, then, or they are not genuine explanations at all.

In 1859, Darwin's theory of evolution by natural selection showed how harmonious systems could have arisen naturally, without the need for a designer. Darwin's theory explains the existence of *X* in *S* as the outcome of a gradual process. Ancestors of *S* who possessed parts similar to *X* survived and reproduced more successfully than their relatives who lacked parts similar to *X*, and these ancestors reproduced true to form (their offspring had organs like *X*, including *S* who has *X*).

Darwin made the designer-hypothesis redundant. Was his theory anti-teleological? Darwin took it as a datum that biological parts and characteristics which have survived the selection process are normally useful for their owners; his theory asserted that they persisted *because* they were useful. This looks like a vindication of Aristotelian extrinsic teleology. Upon further reflection, however, it hardly amounts to a ringing endorsement since Darwin's theory can be stated without employing the term 'function' or any teleological language at all (see DARWIN, C.R.; EVOLUTION, THEORY OF).

Contemporary philosophers separate into two camps on the question of the logic of functional explanations in biology. The 'naturalistic revisionists' *redefine* the concept of function in terms of the causal-historical Darwinian selection hypothesis. They keep the old teleological language but sanitize it (Wright 1976). The other camp consists of 'semantic conservationists' who maintain that natural functionality cannot be *defined* in terms of Darwin's theory (Woodfield 1976). On the latter view, talk of natural functions is committed to assumptions about benefit and harmony and goodness that are extraneous to science and probably perspective-dependent. This view implies that functional explanations are still potentially problematic.

It is possible to maintain that functional explanations of undesigned phenomena have some scientific merit even if they are not wholly objective. Kant argues that the attribution of natural functions to organs is heuristic: it helps to systematize our knowledge of organisms and generates further 'How?' questions. Kant's sophisticated defence does not license the unbridled attribution of good consequences to everything in nature – a tendency ridiculed earlier by Voltaire (see KANT, I. §13).

In the 1980s, naturalistic revisionists, notably Millikan, began to exploit the Darwinian account of functionality as a tool for solving the problem of intentionality. The key insight is that desires, intentions and other mental states with intentional contents can themselves be seen as biologically adaptive states or as the products of mechanisms that are adaptive. The hope is to provide a naturalistic reduction of intentionality. This ambitious research-programme

would make extrinsic teleology more fundamental than intrinsic teleology.

After more than two millennia of debates since Aristotle, teleology continues to provoke lively controversy among analytic philosophers.

TELOS

Telos is the ancient Greek term for an end, fulfilment, completion, goal or aim; it is the source of the modern word 'teleology'. In Greek philosophy the term plays two important and interrelated roles, in ethics and in natural science; both are connected to the most common definitional account of the *telos*, according to which a *telos* is that for the sake of which something is done or occurs.

In ethical theory, each human action is taken to be directed towards some *telos* (i.e. end), and practical deliberation involves specifying the concrete steps needed to attain that *telos*. An agent's life as a whole can also be understood as aimed at the attainment of the agent's overall *telos*, here in the sense of their final end or *summum bonum* ('highest good'), generally identified in antiquity as *eudaimonia* (happiness). Rival ancient ethical theories are distinguished primarily by their rival specifications of the end; the Epicurean *telos* is pleasure, the Stoic *telos* is life according to nature, and so on.

In the natural science of Aristotle, the *telos* of a member of a species is the complete and perfect state of that entity in which it can reproduce itself (so, insects reach their *telos* when they become adults). The *telos* of an organ or capacity is the function it plays in the organism as a whole, or what it is for the sake of; the *telos* of the eye is seeing. Carrying on the tradition of Anaxagoras and Plato, Aristotle centres his scientific methodology around the claim that there are ends in nature, i.e. that some natural phenomena occur for the sake of something; Galen and the Stoics enthusiastically second this; Epicurus rejects it.

TEMPORAL LOGIC

See Tense and temporal logic

TENSE AND TEMPORAL LOGIC

A special kind of logic is needed to represent the valid kinds of arguments involving tensed sentences. The first significant presentation of a tense logic appeared in Prior's work of 1957. Sentential tense logic, in its simplest form, adds to classical sentential logic two tense operators, *P* and *F*. The basic idea is to analyse past and future tenses in terms of prefixes 'It was true that' and 'It will be true that', attached to present-tensed sentences. (Present-tensed sentences do not need present tense operators, since 'It is true that Jane is walking' is equivalent to 'Jane is walking'.) Translating the symbols into English is merely a preliminary to a semantics for tense logic; we may translate '*P*' as 'it was true that' but we still have the question of the meaning of 'it was true that'. There are at least two versions of the tensed theory of time – the minimalist version and the maximalist version – that can be used for the interpretation of the tense logic symbols.

The minimalist version implies that there are no past or future particulars, and thus no things or events that have properties of pastness or futurity. What exists are the things, with their properties and relations, that can be mentioned in certain present-tensed sentences. If 'Jane is walking' is true, then there is a thing, Jane, which possesses the property of walking. 'Socrates was discoursing', even if true, does not contain a name that refers to a past thing, Socrates, since there are no past things. The ontological commitments of past and future tensed sentences are merely to propositions, which are sentence-like abstract objects that are the meanings or senses of sentences. 'Socrates was discoursing' merely commits us to the proposition expressed by the sentence 'It was true that Socrates is discoursing'.

The maximalist tensed theory of time, by contrast, implies that there are past, present and future things and events; that past items possess the property of pastness, present items possess the property of presentness, and future items possess the property of being future. 'Socrates was discoursing' involves a reference to a past thing, Socrates, and implies that the event of Socrates discoursing has the property of being past.

TERTULLIAN, QUINTUS SEPTIMUS FLORENS (*c.* AD 160–*c.* AD 220)

Tertullian was the first Christian theological author to write in Latin, and is responsible for initiating the Latin vocabulary of Christian theology, including such important terms as *persona* (person) and *substantia* (substance). His early works, including the *Apologeticum*, refute pagan misconceptions about Christianity and argue on philosophical and juridical grounds for religious freedom. His later theological treatises, such as *De anima* (On the Soul) and *Adversus Marcionem* (Against Marcion), reflect Tertullian's adherence, in about AD 205–6, to Montanism, a Christian sect which emphasized asceticism, apocalypticism and prophecy. These lengthy works represent an effort to oppose those forms of Christianity that sought to ally themselves with Platonism, such as Gnosticism. After these defences of apocalyptic Christianity, Tertullian fades from historical view around AD 220, leaving a legacy of charismatic truculence.

TESTIMONY

Philosophical treatment of the problems posed by the concept of knowledge has been curiously blind to the role played by testimony in the accumulation and validation of knowledge or, for that matter, justified belief. This is all the more surprising, given that an enormous amount of what any individual can plausibly claim to know, whether in everyday affairs or in theoretical pursuits, is dependent in various ways upon what others have to say. The idea that someone can only really attain knowledge if they get it entirely by the use of their own resources provides a seductive ideal of autonomous knowledge that may help explain the way epistemologists have averted their gaze from the topic of testimony. But, unless they are prepared to limit the scope of knowledge dramatically, theorists who support this individualist ideal of autonomy need to explain how our wide-ranging reliance upon what we are told is consistent with it. Characteristically, those who consider the matter acknowledge the reliance, but seek to show that the individual cognizer can 'justify' dependence upon testimony by sole resort to the individual's resources of observation, memory and inference. Testimony is thus viewed as a second-order source of knowledge. But this reductionist project is subject to major difficulties, as can be seen in David Hume's version. It has problems with the way the proposed justification is structured, with its assumptions about language and with the way the individual's epistemic resources are already enmeshed with testimony. The success or failure of the reductionist project has significant implications for other areas of inquiry.

C.A.J. COADY

TESTIMONY IN INDIAN PHILOSOPHY

A prominent topic in Indian epistemology is *śābdapramāṇa*, knowledge derived from linguistic utterance or testimony. The classical material is extensive and varied, initially concerned with providing grounds for accepting the wisdom of *śruti* or 'the heard word', that is, the canonical scriptures. The Buddhists, however, saw no need for *śābdajñāna* (information gained through words) as an independent source of knowledge, because any utterance (including the Buddha's) that has not been tested in one's own experience cannot be relied upon; and in any case, the operation of such knowledge can be accounted for in terms of inference and perception.

The Nyāya, following the Mīmāṃsā, developed sophisticated analyses and a spirited defence of the viability and autonomy of testimony. The problem is recast thus: is *śābdapramāṇa* linguistic knowledge *eo ipso*, or does verbal understanding amount to knowledge only when certain specifiable conditions, in addition to the generating conditions, are satisfied? The more usual answer is that where the speaker is reliable and sincere, and there is no evidence to the contrary, the generating semantic and phenomenological conditions suffice to deliver valid knowledge. If doubt arises, then other resources can be utilized for checking the truth or falsity of the understanding, or the reliability of the author (or nonpersonal source), and for overcoming the defects.

PURUSHOTTAMA BILIMORIA

THALES (*fl. c.*585 BC)

Known as the first Greek philosopher, Thales initiated a way of understanding the world that was based on reason and nature rather than tradition and mythology. He held that water is in some sense the basic material, that all things are full of gods and (purportedly) that all things possess soul. He predicted an eclipse of the sun and was considered the founder of Greek astronomy and mathematics.

THEORETICAL ENTITIES

See Observation; Scientific realism and antirealism; Theories, scientific

THEORETICAL (EPISTEMIC) VIRTUES

When two competing theories or hypotheses explain or accommodate just the same data (and both are unrefuted), which should be preferred? According to a classical, purely formal confirmation theory, neither – each is confirmed to the same degree, and so the two hypotheses are precisely equal in epistemic status, warrant or credibility. Yet in real life, one of the two may be preferred very strongly, for any of a number of pragmatic reasons: it may be simpler, more readily testable, more fruitful or less at odds with what we already believe. The philosophical question is whether such pragmatic virtues are of no specifically epistemic, truth-conducing value, or are instead genuine reasons for accepting a theory as more likely to be true than is a competitor that lacks them.

WILLIAM G. LYCAN

THEORIES, SCIENTIFIC

The term 'theory' is used variously in science to refer to an unproven hunch, a scientific field (as in 'electromagnetic theory'), and a conceptual device for systematically characterizing the state-transition behaviour of systems. Philosophers of science have tended to view the latter as the most fundamental, and most analyses of theories focus on it.

The Einsteinian revolution involved the rejection of the chemical ether on experimental grounds. It thus prompted philosophers and scientists to examine closely the nature of scientific theories and their connections to observation. Many sought normative analyses that precluded the introduction of 'fictitious' theoretical entities such as the ether. Such analyses amounted to criteria for demarcating scientific or cognitively significant claims from unscientific or metaphysical claims.

Logical positivism sought to develop an ideal language for science that would guarantee cognitive significance. The language was symbolic logic with the nonlogical vocabulary bifurcated into observational and theoretical subvocabularies. Observation terms directly designated observable entities and attributes, and the truth of statements using them was unproblematic. To prevent postulation of fictitious unobservable entities, theoretical terms were allowed only in the context of a theory which guaranteed the cognitive significance of theoretical assertions. Theories were required to contain correspondence rules that interpret theoretical terms by coordinating them in some way with observational conditions.

In the 1960s this 'received view' was attacked on grounds that the observational–theoretical distinction was untenable; that the correspondence rules were a heterogeneous confusion of meaning relationships, experimental design, measurement and causal relationships; that the notion of partial interpretation associated with more liberal requirements on correspondence rules was incoherent; that theories are not axiomatic systems; that symbolic logic is an inappropriate formalism; and that theories are not linguistic entities.

Alternative analyses of theories were suggested – construing theories as answers to scientific problems or as paradigms or conceptual frameworks. Gradually analyses that construe theories as extra-linguistic set-theoretic structures came to dominate post-positivistic thought. The *semantic conception* identifies theories with abstract theory structures like configurated state spaces that stand in mapping relations to phenomena and are the referents of linguistic theory formulations. Depending on the sort of mapping relationship required for theoretical adequacy, realist, quasi-realist or antirealist versions are obtained. Correspondence rules are avoided and some versions eschew observational–nonobservational distinctions altogether. Development of the semantic conception has tended to focus on the mediation of theories and phenomena via observation or experiment, the relations between models and theories, confirmation of theories, their ontological commitments, and semantic relations between theories, phenomena and linguistic formulations. The *structuralist* approach also analyses theories set-theoretically as comprised of a theory structure and a set of intended applications, but is neopositivistic in spirit and in its reliance on a relativized theoretical–nontheoretical term distinction. It has been used to explore theoreticity, the dynamics of theories as they undergo development, and incommensurability notions.

One's analysis of theories tends to influence strongly the position one takes on issues such as such as observation, confirmation and testing, and realism versus instrumentalism versus antirealism.

FREDERICK SUPPE

THEORY OF TYPES

The theory of types was first described by Bertrand Russell in 1908. He was seeking a logical theory that could serve as a framework for mathematics,

and, in particular, a theory that would avoid the so-called 'vicious-circle' antinomies, such as his own paradox of the property of those properties that are not properties of themselves – or, similarly, of the class of those classes that are not members of themselves. Such paradoxes can be thought of as resulting when logical distinctions are not made between different types of entities, and, in particular, between different types of properties and relations that might be predicated of entities, such as the distinction between concrete objects and their properties, and the properties of those properties, and so on. In 'ramified' type theory, the hierarchy of properties and relations is, as it were, two-dimensional, where properties and relations are distinguished first by their order, and then by their level within each order. In 'simple' type theory properties and relations are distinguished only by their orders.

NINO B. COCCHIARELLA

THERMODYNAMICS

Thermodynamics began as the science that elucidated the law-like order present in the behaviour of heat and in its transformations to and from mechanical work. It became of interest to philosophers of science when the nature of heat was discovered to be that of the hidden energy of motion of the microscopic constituents of matter.

Attempts at accounting for the phenomenological laws of heat that make up thermodynamics on the basis of the so-called kinetic theory of heat gave rise to the first fundamental introduction into physics of probabilistic concepts and of probabilistic explanation. This led to so-called statistical mechanics.

Some of the issues of thermodynamics with importance to philosophers are: the meaning of the probabilistic claims made in statistical mechanics; the nature of the probabilistic explanations it proffers for the observed macroscopic phenomena; the structure of the alleged reduction of thermodynamic theory to the theory of the dynamics of the underlying microscopic constituents of matter; the place of cosmological posits in explaining the behaviour of local systems; and the alleged reducibility of our very notion of the asymmetry of time to thermodynamic asymmetries of systems in time.

THOMISM

Deriving from Thomas Aquinas in the thirteenth century, Thomism is a body of philosophical and theological ideas that seeks to articulate the intellectual content of Catholic Christianity. In its nineteenth and twentieth-century revivals Thomism has often characterized itself as the 'perennial philosophy'. This description has several aspects: first, the suggestion that there is a set of central and enduring philosophical questions about reality, knowledge and value; second, that Thomism offers an ever-relevant set of answers to these; and third, that these answers constitute an integrated philosophical system.

In its general orientation Thomism is indeed preoccupied with an ancient philosophical agenda and does claim to offer a comprehensive, non-sceptical and realist response based on a synthesis of Greek thought – in particular that of Aristotle – and Judaeo-Christian religious doctrines. However, in their concern to emphasize the continuity of their tradition, Thomists have sometimes overlooked the extent to which it is reinterpretative of its earlier phases. The period from the original writings of Thomas Aquinas to late twentieth-century neo-scholastic and 'analytical' Thomism covers eight centuries and a stretch of intellectual history more varied in its composition than any other comparable period.

Not only have some self-proclaimed Thomists held positions with which Aquinas would probably have taken issue, some have advanced claims that he would not have been able to understand. Examples of the first are found in Neo-Kantian treatments of epistemology and ethics favoured by some twentieth-century Thomists. Examples of the second include attempts to reconcile Aquinas' philosophy of nature with modern physics, and his informal Aristotelian logic with quantified predicate calculus and possible world semantics.

The term 'Thomism' is sometimes used narrowly to refer to the thought of Aquinas, and to its interpretation and elaboration by sixteenth- and seventeenth-century commentators such as Cajetan, Sylvester of Ferrara, Domingo Bañez and John of St Thomas. At other times it is employed in connection with any view that takes its central ideas from Aquinas but which may depart from other of his doctrines, or which combines his ideas with those of other philosophers and philosophies. Prominent examples of Thomists in this wider sense include Francisco Suárez (1548–1617) who also drew on the epistemology and metaphysics of another great medieval thinker Duns Scotus; and, more recently, Joseph Marechal (1878–1944), whose 'Transcendental Thomism' accepted as its starting point the Kantian assumption that experience is of phenomena and not of reality as it is in itself. An example drawn from the ranks of contemporary analytical philosophers is Peter Geach who draws in equal measure from Aquinas, Frege and Wittgenstein.

In the twentieth century there have been two major proponents of the philosophy of Aquinas, namely Jacques Maritain and Etienne Gilson, both of whom contributed significantly to the development of Neo-Thomism in North America. Interestingly, both men were French, neither had been trained in a Thomistic tradition and both were drawn into philosophy by attending lectures by Henri Bergson at the Collège de France in Paris. The Neo-Thomism they inspired declined following the Second Vatican Council (1962–5) as Catholics looked to other philosophical movements, including existentialism and phenomenology, or away from philosophy altogether. Today Thomists tend to be close followers and interpreters of the writings of Aquinas, but there is also a growing interest among mainstream English-language philosophers in some of his central ideas. While not a movement, this approach has been described as 'analytical' Thomism.

JOHN J. HALDANE

THOREAU, HENRY DAVID (1817–62)

Thoreau was one of the founders of the new literature that emerged within the fledgling culture of the United States in the middle decades of the nineteenth century. He inherited an education in the classics and in the transcendentalism of his older friend and teacher Ralph Waldo Emerson. Thoreau forged a means of writing which was dedicated to recording particular events in all their transience but capable of rendering graphic the permanent laws of nature and conscience. His incorporation of both confidence and self-questioning into the texture of his writing forms the ground of his standpoint as an observer of human lives and other natural histories.

Thoreau's relation to philosophy goes beyond his inheritance from Plato, Kant, Emerson and Eastern thought. Above all, his quest for philosophy is evident in the ways his writing seeks its own foundations. It is in the act of writing that Thoreau locates the perspectives within which to give an account of the humanness of a life. His project is to report sincerely and unselfconsciously a life of passion and simplicity, using himself as a representative of basic human needs and projects. Influenced by Plato's *Republic*, Thoreau gives an account of some basic human needs, such as food, shelter and society. But also, like Plato, he shows that the particular institutions by which human needs are met are very far from being necessary. Tracing the relationship between need and necessity is one of the primary goals of Thoreau's work.

TIMOTHY GOULD

THOUGHT EXPERIMENTS

Thought experiments are strange: they have the power to present surprising results and can profoundly change the way we view the world, all without requiring us to examine the world in the way that ordinary scientific experiments do. Philosophers who view all hypothetical reasoning as a form of thought experimentation regard the method as being as old as philosophy itself. Others maintain that truly informative thought experiments are found only in mathematics and the natural sciences. These emerged in the seventeenth century when the new experimental science of Bacon, Boyle, Galileo, Newton and others forced a distinction between the passive observation of Aristotelian mental narratives and the active interventions of real-world experiment. The new science gave rise to a philosophical puzzle: how can mere thought be so informative about the world? Rationalists argue that thought experiments are exercises in which thought apprehends laws of nature and mathematical truths directly. Empiricists argue that thought experiments are not exercises of 'mere thought' because they actually rely upon hidden empirical information – otherwise they would not count as experiments at all. More recently it has been argued that thought experiments are not mysterious because they are constructed arguments that are embedded in the world so as to combine logical and conceptual analysis with relevant features of the world.

TIME

Introduction

Time is the single most pervasive component of our experience and the most fundamental concept in our physical theories. For these reasons time has received intensive attention from philosophy. Reflection on our ordinary-tensed language of time has led many to posit a relation of metaphysical importance between time and existence. Closely connected with such intuitions are claims to the

effect that time is unlike space, and in deep and important ways.

The development of physical theories from Newtonian dynamics through relativistic theories, statistical mechanics, and quantum mechanics has had a profound effect on philosophical views about time. Relativity threatens the notion of a universal, global present, and with it the alleged connections of time to existence. The connection between temporal order and causal order in relativity theories, and between the asymmetry of time and entropic asymmetry in statistical mechanics, suggest various 'reductive' accounts of temporal phenomena.

Finally, the radical differences between time as it appears in our physical theory and time as it appears in our immediate experience, show important and difficult problems concerning the relation of the time of 'theory' to the time of 'our immediate awareness'.

1 Time and existence

There is much philosophical debate about the degree to which the temporality of the world is like or unlike its spatiality. All agree that space and time differ in their dimensionality, and all agree, even in a relativistic context, that the temporality of the world is not a spatial dimension. Spatial and temporal aspects of the world are, for example, differentially interconnected with causal features.

One aspect that distinguishes time from space is the intuitive asymmetry of the former, unmatched by any related feature of the latter. While there is debate about what this asymmetry consists in, and how it is connected to other features of the world such as entropic asymmetry, there is not much question that it is uniquely characteristic of the temporal structure of the world (see THERMODYNAMICS).

But that distinction alone is often thought insufficient to capture the special nature of time. Expressions such as the 'flux' or 'flow' of time are often invoked metaphorically to capture what is intended, as in Bergson's treatment of temporality (see BERGSON, H.-L.). McTaggart distinguished between those aspects of time that could be characterized using timeless temporal relations (such as one event being after another), called by him the B-series, and those aspects of time that were expressed in tensed discourse, called by him the A-series. It was McTaggart's contention that only the A-series captured the essence of temporality, but that since this essence was self-contradictory, time was 'unreal' (see MCTAGGART, J.M.E.).

The core of such claims lies, perhaps, in the intuition expressed by St Augustine that while being elsewhere than here hardly reduced the reality of an object, that which was not presently existing had no genuine existence at all (see AUGUSTINE). Other versions of this line take it that only past and present have 'determinate reality', the future, not yet having come into being, having no genuine determinate reality at all.

An important response to such ideas argues that there is no ultimate distinction in 'reality' between the present as contrasted with the past and future or between the present and past as contrasted with the future. This approach admits that past and future do not 'exist', of course, if 'exist' is being used in its tensed form, but finds in that only an interesting feature of natural language (having tensed-verb forms but no parallel structure for spatial location) and not anything of metaphysical importance.

McTaggart's claim that tensed expressions cannot be translated into tenseless ones, since the former have truth-values that vary with time and the latter do not, is admitted, but the proponents of the view that nothing metaphysical is represented by tense take it that this shows only that tensed discourse has an ineliminable 'token reflexive' or 'indexical' nature. To say '*x* occurred' is to say '*x* occurred before *now*'. 'Now' is a term whose reference varies with its use, since it refers to any moment of time at which it is uttered. Only this implicit indexicality, it is claimed, distinguishes tensed from untensed discourse, not some ability of the former but not the latter to capture the essential metaphysical nature of time.

Those who reject this line offer several ways of trying to express what they think is missing in its account. Tense logics and models of splitting worlds (with the past as unique and the future as still offering manifold possibilities) are one approach. Others note the analogy with modal logic where the actual world is (in most accounts) metaphysically distinguished in its reality from the other possible worlds, much as the present is, allegedly, distinguished in its reality from other temporal moments of past and future (see TENSE AND TEMPORAL LOGIC). The analogy goes only so far, however, since each moment of time is, when it is the present, the moment of reality. Formulating a fully fledged metaphysical perspectivalism that would capture the essence of the metaphysical claims of those who think time is specially connected with existence has proven a difficult task.

2 Relationism and its problems

Just as in philosophical explorations of space, the idea that time can be considered as nothing but a structured family of relations of material events is an important one (see SPACE). The doctrine is, perhaps, already implicit in Aristotle's description of time as 'the measure of motion' and becomes explicit in Leibniz's fully fledged relationism for space and time (see LEIBNIZ, G.W. §11).

One question that immediately arises in a relationist perspective is whether there could be passage of time without change (see CHANGE). One response to this is to introduce modality into the discourse. Just as empty space can be thought of as given by unactualized possibilities of spatial relations, so one might think of time intervals without actual change as given by possible but not actual changes. Important insights are contained in the notion of limits to situations themselves relationally acceptable (such as the limit of a sequence of ever-larger regions of the universe that abide without change).

NEWTON introduces novel elements into the philosophical discussion in his insistence on 'absolute time' to accompany space as a reference frame for absolute inertial motions. Many relationists like to think of the time interval as being arbitrarily specified by any periodic process. Newton emphasizes the distinction between the ideal process and any actual one. More importantly his theory, with its notion of distinguished, absolutely uniform motions, presupposes that uniformity of time interval is fixed by physical processes other than arbitrarily chosen periodic processes. Without an absolute notion of equality of time interval the absolute notion of uniformity of motion is incoherent.

Within contemporary relativistic theories the issue of the adequacy of a relationist account of time becomes absorbed into the more general issues concerning the opposition between relationistically and substantivally interpreted spacetime theories (see RELATIVITY THEORY, PHILOSOPHICAL SIGNIFICANCE OF).

3 Time in relativistic theories

The introduction of the novel conceptualization of space and time forced upon us by the theories of special and general relativity once again illustrates the crucial interdependence of philosophical and physicist thought in this area.

In the special theory of relativity, the notion of simultaneity for events spatially separated from one another, and with it the time interval between any two separated non-simultaneous events, becomes relative to a chosen inertial reference frame (see RELATIVITY THEORY, PHILOSOPHICAL SIGNIFICANCE OF). There is no longer a global 'now' that selects one and the same set of events for all observers, no matter what their state of motion relative to one another. Such a relativization of the notion of time is not to be confused with the relationist conception of time described above. With the advent of special relativity one has the beginning of the radical divergence between our intuitive notions of time and those posited by physical theories.

It is often claimed that within the relativistic picture the doctrines that connect existence with temporality (as discussed above) are no longer viable. If what is present and what is past can vary from observer to observer, then how can one maintain that past and future (or, alternatively, future alone) have no genuine reality? A frequent claim is that relativity forces upon us the view of the timelessness of existence contrasted with the 'essentially tensed nature of existence' theories.

As is so often the case, however, such an inference from physics to philosophy is premature. One could, for example, relativize one's notion of existence, thus claiming that past and future are unreal, but that events unreal for one observer can be real for another observer itself real to the first. Alternatively, one could utilize only invariant spacetime features in the account. In one version of this approach the past remains real at a spacetime point-event, in the sense of the past light-cone at the point-event constituting the real (see RELATIVITY THEORY, PHILOSOPHICAL SIGNIFICANCE OF). In another version reality is collapsed even more radically than in the Augustinian view, so that what is real at a place–time is only that unextended point place–time and its features.

General relativity, with its dynamic spacetime, makes matters even more peculiar. Models of the world in this theory exist with closed timelike curves. In such a world an event can be (globally) in its own past and future (see TIME TRAVEL). Such possibilities led Kurt Gödel to assert that time was 'ideal' and that the '*t*' parameter of physics did not stand for time at all.

4 Time and causation

Various claims have been made to the effect that time 'is defined by' or 'reduces to' some other feature of the world. Causal theories date back to Leibniz, who pointed out that simultaneity for events could be characterized by their not being causally connectable. The breakdown of this association in the special theory of relativity is

often taken as the key factor in claims to the effect that distant simultaneity is a matter of convention.

The issue of the extent to which temporal notions are, or are not, causally definable in relativistic theories is a complex one. In the special theory there is a relation framed in terms of causal connectability that is coextensive with simultaneity. In general relativity causal definitions of temporal metric and topological notions utilizing causal connectability alone fail in general. But one can characterize topological spatiotemporal notions in terms of the continuity of causal (timelike) paths. This suggests a reduction of the spatiotemporal notions not to causal notions *per se*, but to the epistemically accessible topological features of the spacetime, those directly available to an observer (see RELATIVITY THEORY, PHILOSOPHICAL SIGNIFICANCE OF).

Both the physical connections of spatial and temporal (and spatiotemporal) features to causal features of the world, and the philosophical understanding of what these might tell us about 'what time is' in the world, remain controversial issues (see CAUSATION).

5 Time in experience and time in nature

Temporality enters our conceptual framework both as a descriptive component of our immediate experience and as a component of our theoretical description of the physical world. But how are these aspects of time related to one another? This would be a problem for philosophy even if we took the time of nature to have the features we think of time having prescientifically. Once we have been told by science that time in nature is radically unlike anything we encounter in our immediate experience, as we seem to be told in relativistic theories and as we are likely to be even more radically informed when a fully quantum mechanical account of spacetime is forthcoming, the problem of relating experienced time to the time of theory becomes even more pressing.

One tradition starts from the time of our immediate experience and suggests that the time of nature is in some way or another a construct dependent on the time of conscious awareness. A seminal version of this approach is the treatment of time in Kant (*Critique of Pure Reason* 1781/1787). Time is, along with space, one of the structuring principles of all experience, called by Kant a pure intuition. As such it is a feature of the phenomenal world and not of 'things-in-themselves'. Both outer experience of physical objects and inner experience of psychological states are framed in the format of the temporal intuitive structure. Behind the temporal psychological self is the transcendental self, that which unifies all our experience with its implicit 'I think'. Non-temporal, the transcendental self is the ground of the temporal structuring of physical and psychological experience (see KANT, I. §§5–7).

The idealist tradition is continued in Husserl's phenomenological account of the ground and nature of our experience of time. Here emphasis is placed on what the necessary features of such experience must be like in order that we experience things as past, present and future, and have the sense that we do of time as passage. In Heidegger's pragmatist-phenomenology, time as it functions in human activity is the ground of time altogether (see HEIDEGGER, M. §§1–2). One begins with time as it appears in our experienced world of the fixed past, the present of action and the future of projected intentions. The time of nature and science, the time of the 'present-at-hand', is only derivative from the primordial time of experience as decision and action. In these (external, transcendental) idealist accounts of time, the time of past, present and future is taken as central.

Contrasted with such approaches is that of the physicalist-naturalist, to whom the time of the physical world is basic and the time of human experience supervenient at best. In these accounts it is the timeless temporal relations of the B-series that are usually taken as fundamental. Time in experience is usually thought of in something in the vein of a secondary quality.

But even such naturalistic accounts have their problematic aspects. Any proposal to make time as experienced a mere secondary quality (such as that of Gödel noted above), and that takes the '*t*' of physics to be a parameter disconnected from time as we immediately encounter it, leaves little ground for understanding how physical theories can receive a realistic (as opposed to instrumentalistic) interpretation, or for theoretical realism in general (see SCIENTIFIC REALISM AND ANTIREALISM).

TIME TRAVEL

The prospect of a machine in which one could be transported through time is no longer mere fantasy, having become in this century the subject of serious scientific and philosophical debate. From Einstein's special theory of relativity we have learned that a form of time travel into the future may be accomplished by moving quickly, and therefore ageing slowly (exploiting the time dilation effect). And in 1949 Kurt Gödel announced his discovery of (general relativistic) spacetimes whose global curvature allows voyages into the past as well. Since then the study of time travel has had three main strands. First, there has been research by theoretical physicists into the character and plausibility of structures, beyond those found by Gödel, that could engender closed timelike lines and closed causal chains. These phenomena include rotating universes, black holes, traversable wormholes and infinite cosmic strings. Second, there has been concern with the semantic issue of whether the terms 'cause', 'time' and 'travel' are applicable, strictly speaking, to such bizarre models, given how different they are from the contexts in which those terms are normally employed. However, one may be sceptical about the significance of this issue, since the questions of primary interest – focused on the nature and reality of the Gödel-style models – seem independent of whether their description requires a shift in the meanings of those words. And, third, there has been considerable discussion within both physics and philosophy of various alleged paradoxes of time travel, and of their power to preclude the spacetime models in which time travel could occur.

TOLERATION

Toleration emerged as an important idea in the seventeenth century, receiving its fullest defence in John Locke's *A Letter Concerning Toleration* (1689). Initially developed in the context of attempts to restore peace in a Europe convulsed by religious conflicts, in the nineteenth and twentieth centuries it came to be extended to the accommodation of disputes about racial, sexual and social differences. Toleration is widely thought to be an essential element of a free society, especially one marked by moral and cultural pluralism, and it figures particularly prominently in the political theory of liberalism.

The paradigm example of toleration is the deliberate decision to refrain from prohibiting, hindering or otherwise coercively interfering with conduct of which one disapproves, although one has the power to do so. The principal components of the concept of toleration are: a tolerating subject and a tolerated subject (either may be an individual, group, organization or institution); an action, belief or practice which is the object of toleration; a negative attitude (dislike or moral disapproval) on the part of tolerator toward the object of toleration; and a significant degree of restraint in acting against it.

Philosophical arguments have mostly concerned: the range of toleration (what things should or should not be tolerated?); the degree of restraint required by toleration (what forms of opposition are consistent with toleration?); and, most importantly, the justification of toleration (why should some things be tolerated?).

JOHN HORTON

TOLSTOI, COUNT LEV NIKOLAEVICH (1828–1910)

Tolstoi expressed philosophical ideas in his novels *Voina i mir* (*War and Peace*) (1865–9) and *Anna Karenina* (1875–7), which are often regarded as the summit of realism, as well as in shorter fictional works, such as *Smert' Ivana Il'icha* (The Death of Ivan Il'ich) (1886), often praised as the finest novella in European literature. In addition, he wrote numerous essays and tracts on religious, moral, social, educational and aesthetic topics, most notably 'Chto takoe iskusstvo?' ('What Is Art?') (1898), *Tsarstvo Bozhie vnutri vas* (*The Kingdom of God Is Within You*) (1893) and his autobiographical meditation 'Ispoved' (A Confession) (1884).

Tolstoi apparently used his essays, letters and diaries to explore ideas by stating them in their most extreme form, while his fiction developed them with much greater subtlety. Critics have discerned a sharp break in his work: an earlier period, in which he produced the two great novels, is dominated by deep scepticism; and a later period following the existential trauma and subsequent conversion experience described in 'Ispoved'. Tolstoi stressed the radical contingency of events, valued practical over theoretical reasoning, and satirized any and all overarching systems. After 1880, he assumed the role of a prophet, claiming to have found the true meaning of Christianity. He 'edited' the Gospels by keeping only those passages containing the essence of Christ's teaching and dismissed the rest as so many layers of falsification imposed by ecclesiastics. Tolstoi preached pacifism, anarchism, vegetarian-ism, passive resistance to evil (a doctrine that

influenced Gandhi), a radical asceticism that would have banned sex even within marriage, and a theory of art that rejected most classic authors, including the plays of Shakespeare and Tolstoi's own earlier novels.

GARY SAUL MORSON

TOTALITARIANISM

A term adopted in the 1920s by the Italian philosopher Giovanni Gentile to describe the ideal fascist state, 'totalitarianism' quickly acquired negative connotations as it was applied to the regimes of Hitler in Germany and Stalin in the USSR. Within political science it has generally been used to refer to a distinctively modern form of dictatorship based not only on terror but also on mass support mobilized behind an ideology prescribing radical social change. Controversially, the specific content of the ideology is considered less significant than the regime's determination to form the minds of the population through control of all communications.

Totalitarianism has attracted the attention of philosophers as well as political scientists because a number of classic philosophical systems have been suspected of harbouring totalitarian aspirations, and also because the model of total power exercised through discourse has been used by critical theorists to mount an attack on modernity in general.

MARGARET CANOVAN

TRADITION AND TRADITIONALISM

Tradition is that body of practice and belief which is socially transmitted from the past. It is regarded as having authority in the present simply because it comes from the past, and encapsulates the wisdom and experience of the past. For some, the very idea of tradition is anathema. It is characteristic of modernity to reject the authority of the past in favour of the present deployment of reason, unencumbered by tradition or prejudice. While prior to the seventeenth century tradition was largely unquestioned as a source of insight, and in need of no defence, since the Enlightenment the notion of tradition has been defended by traditionalists such as Burke and, more recently, Hayek. Upon inspection, however, traditionalism, if not indefensibly irrational, turns out to be a demonstration of the overlooked rationality contained within traditions. Traditions often turn out upon inspection to be not so much irrational as subtle and flexible deployments of reason in particular spheres.

ANTHONY O'HEAR

TRAGEDY

Tragedy is primarily a type of drama, though non-dramatic poetry ('lyric tragedy') and some novels (for example, *Moby Dick*) have laid claim to the description. As a genre, it began in ancient Greece and forms a part of the Western European tradition. Historically, it has carried prestige for playwrights and actors because it dealt with persons, generally men, of 'high' or noble birth, who, by virtue of their stature, represented the most profound sufferings and conflicts of humanity, both morally and metaphysically. The history of the genre is part of the history of how art and culture reflect views about class and gender.

Tragic theory has concentrated primarily on how to define the genre. A persistent feature is the tragic hero, who begins by occupying a position of power or nobility, but comes to a catastrophic end through some action of his own. According to the Aristotelian tradition, the audience is supposed to experience pity and fear in response to the sufferings of the tragic hero, and perhaps pleasure from its cathartic effects. Hegel initiated a paradigm shift in tragic theory in proposing that tragic plots essentially involve conflicts of duty rather than suffering.

Greek tragedy and Shakespearean tragedy provide two different exemplars of the genre. The tradition inspired by Greek tragedy emphasized a rigidly defined genre of dramatic poetry; French neoclassic tragedy is part of this tradition. Shakespearean tragedy, on the other hand, is written partly in prose, and includes comic elements and characters who are not nobly born. Lessing and Ibsen also resisted restraints imposed on the genre in terms of its representation of social class and gender in favour of drama that was more realistic and relevant to a bourgeois audience. Twentieth-century criticism has questioned the viability of the genre for modern times.

SUSAN L. FEAGIN

TRANSCENDENTAL ARGUMENTS

Introduction

Transcendental arguments seek to answer scepticism by showing that the things doubted by a sceptic are in fact preconditions for the scepticism to make sense. Hence the scepticism is either meaningless or false. A transcendental argument works by finding the preconditions of meaningful thought

or judgment. For example, scepticism about other minds suggests that only the thinker themselves might have sensations. A transcendental argument which answered this scepticism would show that a precondition for thinking oneself to have sensations is that others do so as well. Expressing the scepticism involves thinking oneself to have sensations; and the argument shows that if this thought is expressible, then it is also false.

Arguments with such powerful consequences have, unsurprisingly, been much criticized. One criticism is that it is not possible to discover the necessary conditions of judgment. Another is that transcendental arguments can only show us how we have to think, whereas defeating scepticism involves showing instead how things really are.

1 Nature of argument

The name 'transcendental argument' originally comes from Kant, who called the most difficult part of his most difficult work a 'transcendental deduction' (see KANT, I. §6). In the twentieth century, the name has been applied by both proponents and critics to a loosely similar set of arguments, sometimes directly inspired by Kant, sometimes not. The central figure in re-launching such arguments was P.F. STRAWSON in his work on metaphysics, *Individuals* (1959), and his reconstruction of Kant, *The Bounds of Sense* (1966). Subsequently the work of Davidson, Putnam and Searle on the relations between language and the world has been called 'transcendental argument' both by themselves and by others; indeed Richard Rorty calls Davidson's argument a 'transcendental argument to end all transcendental arguments'.

One example of a transcendental argument is Strawson's attack on scepticism about other minds. He maintains that the ability to attribute mental states to others is a precondition for attributing mental states to oneself. Therefore, if the scepticism is stated in its standard form of wondering whether anyone apart from the thinker has thoughts or feelings, it is also answerable. For the argument shows that a precondition for any such wondering is that we also attribute such states to others. Hence, if scepticism makes sense at all, it is mistaken; the sceptic is reduced to either error or silence.

This particular example is a kind of private language argument (see PRIVATE LANGUAGE ARGUMENT). Wittgenstein has retrospectively been seen as having made these kinds of arguments, as more obviously and recently has Donald DAVIDSON. The closest analogy to them in Kant is not the *Transcendental Deduction* but, rather, the *Refutation of Idealism*, where Kant argued that knowledge of outer states is a precondition for knowledge of inner states, and hence claimed that 'the game played by idealism has been turned against itself' (*Critique of Pure Reason* 1781/1787: B276). As in Strawson, the way that the sceptical position (here idealism) enters the game means that it can be defeated.

This briefly sketched family of arguments illustrates several things about modern transcendental arguments. They are arguments about the preconditions of thought or judgment. They start with a supposition about our thoughts, such as that we have thoughts of some particular kind. A necessary condition for having such thoughts is then derived, followed by a necessary condition for this necessary condition, and so on. Assuming that the first assumption is correct, all its necessary conditions will then have been found also to apply.

2 Problems

As an answer to scepticism, a transcendental argument is only as strong as its initial assumption. In the example in §1 above, the assumption is that we think ourselves to have mental states. However, a sceptic could try to meet this by claiming that we might be mistaken about the content of our thoughts. Similarly Putnam's transcendental argument that we would not even be able to think that we were seeing an apple unless this kind of state was typically caused by real apples (and hence that external-world scepticism must be false) could be met by doubting whether I correctly identify my thoughts as being of the apple variety.

If, however, the initial assumption is not about the contents of thoughts but is just that there is thought (or language), then the sceptical move can be met. For this is something which no one, and hence no sceptic, can properly think that they doubt. Hence the most robust transcendental arguments concern themselves merely with the preconditions of there being thought or language at all. Examples are (again) the Private Language Argument, or Davidson's argument that there is only one conceptual scheme. The next possible point of weakness after the initial assumption is the discovery of its necessary conditions. Obviously this must not have a purely observational basis. The argument that people could not think without brains – we think, hence we have brains, hence the external world exists – would not be an effective answer to scepticism. So the arguments have to be (at least relatively) a priori.

Some people have therefore held that transcendental arguments may only draw out the purely conceptual, or analytic, consequences of their initial assumptions. This gives them better security against scepticism but makes their chances of reaching interesting conclusions rather slim. Others have held, rather more ambitiously, that the connections do not need to be narrowly analytic: transcendental arguments show the necessary conditions for having thoughts. Therefore, if the having of one kind of thought is a necessary condition for having another kind of thought, this will be good enough, even if the contents of the thoughts themselves are not analytically connected.

3 Further criticisms

In transcendental arguments, necessary conditions are often demonstrated by discovering the unique conditions which enable some kind of thought to be had. Yet it has been claimed, most prominently by Stefan Körner (1969), that the uniqueness of a conceptual structure cannot be established. Uniqueness, he says, could only be demonstrated by the elimination of all possible rivals. Yet although we may eliminate all rivals that occur to us, there may always be a possibility that we might have overlooked or might not be able to envisage. Other people have similarly claimed that, at best, we can only describe how we currently think, or the limits of currently imaginable alternatives. However, neither of these can show how we must think; they cannot demonstrate the necessary conditions of thought.

Another criticism is that, even if it can be shown what we must think, this will not defeat scepticism. Defeating scepticism demands a demonstration that we are justified in thinking that our beliefs show how things actually are. However, showing that we must think something does not show that the thought is correct – a necessary illusion is still an illusion. The force of this criticism depends on the kinds of necessary conditions derived in transcendental arguments. If some matter of fact is shown to be a necessary condition for having thoughts, then it does not apply. However, in modern arguments, the necessary conditions derived for having one kind of thought are frequently other kinds of thought. For example in the Strawson argument discussed above in §1, it is belief in other people's pains that is the required presupposition. It can be objected that this is insufficient to answer scepticism (in this case about other minds) since the crucial point is not whether we have to believe that others have pains, but, rather, whether this belief is correct.

A version of this objection is the one which Stroud mounts against Strawson and others in his highly influential paper of 1968 about transcendental arguments. This is his claim that transcendental arguments need a version of the Verification Principle in order to work (see MEANING AND VERIFICATION). However, Stroud continues, if we are entitled to presuppose the Verification Principle, then transcendental arguments are not needed, since the Verification Principle by itself will do the anti-sceptical work. The principle shows that it makes no sense to suppose that our best-verified beliefs might not be true. Analogously, it can show that it makes no sense to suppose that beliefs that we must have are not true. However it is the verificationist assumption which is doing the deadly anti-sceptical work, not the transcendental argument which gets us from belief to necessary belief. Therefore the route through necessary belief is superfluous; transcendental arguments are either redundant or invalid.

Alternatively, the transition from what we (have to) believe to how things actually are can be made by shrinking the distance between them. A supposition of idealism would do this; so that in the end we do not distinguish between the structure of thought and an independent, real world waiting to be described. In Kant, some kind of idealism was required in order to make the transcendental arguments work, and it has been suggested by Bernard Williams (1973) and others that this also applies to modern users of transcendental arguments. However, some modern users would not take this to be a criticism (see IDEALISM; REALISM AND ANTIREALISM).

TRANSLATION, RADICAL

See RADICAL TRANSLATION AND RADICAL INTERPRETATION

TRINITY

The doctrine of the Holy Trinity is a central and essential element of Christian theology. The part of the doctrine that is of special concern in here may be stated in these words: the Father, the Son and the Holy Spirit are each God; they are distinct from one another; and yet (in the words of the Athanasian Creed), 'they are not three Gods, but there is one God'. This is not to be explained by saying that 'the Father', 'the Son' and 'the Holy Spirit' are three names that are applied to the one God in various circumstances; nor is it to be explained by saying that the Father, the Son, and the Holy Spirit are parts or aspects of God (like the leaves of a shamrock or the faces of a cube). In the words of St Augustine:

> Thus there are the Father, the Son, and the Holy Spirit, and each is God and at the same time all are one God; and each of them is a full substance, and at the same time all are one substance. The Father is neither the Son nor the Holy Spirit; the Son is neither the Father nor the Holy Spirit; the Holy Spirit is neither the Father nor the Son. But the Father is the Father uniquely; the Son is the Son uniquely; and the Holy Spirit is the Holy Spirit uniquely.
>
> (*De doctrina christiana* I, 5, 5)

The doctrine of the Trinity seems on the face of it to be logically incoherent. It seems to imply that identity is not transitive – for the Father is identical with God, the Son is identical with God, and the Father is not identical with the Son. There have been two recent attempts by philosophers to defend the logical coherency of the doctrine. Richard Swinburne has suggested that the Father, the Son and the Holy Spirit be thought of as numerically distinct Gods, and he has argued that, properly understood, this suggestion is consistent with historical orthodoxy. Peter Geach and various others have suggested that a coherent statement of the doctrine is possible on the assumption that identity is 'always relative to a sortal term'. Swinburne's formulation of the doctrine of the Trinity is certainly free from logical incoherency, but it is debatable whether it is consistent with historical orthodoxy. As to 'relative identity' formulations of the doctrine, not all philosophers would agree that the idea that identity is always relative to a sortal term is even intelligible.

PETER VAN INWAGEN

TRUST

Most people writing on trust accept the following claims: trust involves risk; trusters do not constantly monitor those they trust; trust enhances the effectiveness of agency; and trust and distrust are self-confirming. Three further claims are widely accepted: trust and distrust are contraries but not contradictories; trust cannot be willed; and trust has noninstrumental value. Accounts of trust divide into three families: risk-assessment accounts, which are indifferent to the reasons why one trusts; will-based accounts, which stress the importance of the motives of those who are trusted; and affective attitude accounts, which claim that trust is a feeling as well as a judgment and a disposition to act. One of the central questions concerns when trust is justified, and, in particular, whether justified trusting can outstrip evidence for the belief that the person trusted is trustworthy. If trust can leap ahead of evidence of trustworthiness, then trust poses a problem for evidentialism, or the view that one should never believe anything without sufficient evidence. Further central questions include whether trusting is a virtue and trustworthiness morally required, while a final set of questions concerns the role of trust in politics and the connection between interpersonal trust and trust in institutions.

TRUTH, COHERENCE THEORY OF

The term 'coherence' in the phrase 'coherence theory of truth' has never been very precisely defined. The most we can say by way of a general definition is that a set of two or more beliefs are said to cohere if they 'fit' together or 'agree' with one another. Typically, then, a coherence theory of truth would claim that the beliefs of a given individual are true to the extent that the set of all their beliefs is coherent. Such theories, thus, make truth a matter of a truth bearer's relations to other truth bearers rather than its relations to reality. This latter

implication is the chief hindrance to plausibility faced by coherence theories, and most coherence theorists try to escape the problem by denying that there is any extra-mental reality.

RICHARD L. KIRKHAM

TRUTH, CORRESPONDENCE THEORY OF

The two oldest theories of truth in Western philosophy, those of Plato and Aristotle, are both correspondence theories. And if the non-philosopher can be said to subscribe to a theory of truth, it would most likely be to a correspondence theory; so called because such theories are often summed up with the slogans 'truth is correspondence with the facts' or 'truth is agreement with reality'. Aristotle puts it thus: 'to say that [either] that which is is *not* or that which is not *is*, is a falsehood; and to say that that which is is and that which is not is not, is true'. In epistemology, such theories offer an analysis of that at which, supposedly, investigation aims: truth. But correspondence theories are also now thought to play important roles in philosophical semantics and in the physicalist programme, which is the task of reducing all non-physical concepts to the concepts of logic, mathematics, and physics.

See also: Meaning and truth; Realism and antirealism; Truth, coherence theory of; Truth, deflationary theories of; Truth, pragmatic theory of

RICHARD L. KIRKHAM

TRUTH, DEFLATIONARY THEORIES OF

So-called deflationary theories of truth, of which the best known are the redundancy, performative and prosentential theories, are really theories of truth *ascriptions*. This is because they are not theories of what truth *is*; rather, they are theories of what we are saying when we make utterances like '"Routledge editors are fine folks" is true'. The surface grammar of such utterances suggests that we use them to predicate a property, truth, of sentences or propositions; but the several deflationary theories all deny this. Indeed, they all endorse the deflationary thesis that there is no such property as truth and thus there is no need for, or sense to, a theory of truth distinct from a theory of truth ascriptions. Thus, for deflationists, the classical theories of truth, such as correspondence, coherence and pragmatic, are not wrong. They are something worse: they are wrong-headed from the start, for they are attempting to analyse something which simply *is not there*.

See also: Justification, epistemic; Meaning and truth; Truth, coherence theory of; Truth, correspondence theory of; Truth, pragmatic theory of

RICHARD L. KIRKHAM

TRUTH, PRAGMATIC THEORY OF

Two distinctly different kinds of theories parade under the banner of the 'pragmatic theory of truth'. First, there is the consensus theory of C.S. Peirce, according to which a true proposition is one which would be endorsed unanimously by all persons who had had sufficient relevant experiences to judge it. Second, there is the instrumentalist theory associated with William James, John Dewey, and F.C.S. Schiller, according to which a proposition counts as true if and only if behaviour based on a belief in the proposition leads, in the long run and all things considered, to beneficial results for the believers. (Peirce renamed his theory 'pragmaticism' when his original term 'pragmatism' was appropriated by the instrumentalists.) Unless they are married to some form of ontological anti-realism, which they usually are, both theories imply that the facts of the matter are not relevant to the truth-value of the proposition.

TRUTH-CONDITIONAL SEMANTICS

See Meaning and truth

TRUTHFULNESS

Humans are the only species capable of speech and thus of lies. Choices regarding truthfulness and deceit are woven into all that they say and do. From childhood on, everyone knows the experience of being deceived and of deceiving others, of doubting someone's word and of being thought a liar. Throughout life, no moral choice is more common than that of whether to speak truthfully, equivocate, or lie – whether to flatter, get out of trouble, retaliate, or gain some advantage.

All societies, as well as all major moral, religious and legal traditions have condemned forms of deceit such as bearing false witness; but many have also held that deceit can be excusable or even mandated under certain circumstances, as, for instance, to deflect enemies in war or criminals bent on doing violence to innocent victims. Opinions diverge about such

cases, however, as well as about many common choices about truthfulness and deceit. How open should spouses be to one another about adultery, for example, or physicians to dying patients? These are quandaries familiar since antiquity. Others, such as those involving the backdating of computerized documents, false claims on résumés in applying for work, or misrepresenting one's HIV-positive status to sexual partners, present themselves in new garb.

Hard choices involving truthfulness and lying inevitably raise certain underlying questions. How should truthfulness be defined? Is lying ever morally justified, and if so under what conditions? How should one deal with borderline cases between truthfulness and clear-cut falsehood, and between more and less egregious forms of deceit? And how do attitudes towards truthfulness relate to personal integrity and character? The rich philosophical debate of these issues has focused on issues of definition, justification, and line-drawing, and on their relevance to practical moral choice.

TURING, ALAN MATHISON (1912–54)

Alan Turing was a mathematical logician who made fundamental contributions to the theory of computation. He developed the concept of an abstract computing device (a 'Turing machine') which precisely characterizes the concept of computation, and provided the basis for the practical development of electronic digital computers beginning in the 1940s. He demonstrated both the scope and limitations of computation, proving that some mathematical functions are not computable in principle by such machines.

Turing believed that human behaviour might be understood in terms of computation, and his views inspired contemporary computational theories of mind. He proposed a comparative test for machine intelligence, the 'Turing test', in which a human interrogator tries to distinguish a computer from a human by interacting with them only over a teletypewriter. Although the validity of the Turing test is controversial, the test and modifications of it remain influential measures for evaluating artificial intelligence.

JAMES H. MOOR

TURING MACHINES

Turing machines are abstract computing devices, named after Alan Mathison Turing. A Turing machine operates on a potentially infinite tape uniformly divided into squares, and is capable of entering only a finite number of distinct internal configurations. Each square may contain a symbol from a finite alphabet. The machine can scan one square at a time and perform, depending on the content of the scanned square and its own internal configuration, one of the following operations: print or erase a symbol on the scanned square or move on to scan either one of the immediately adjacent squares. These elementary operations are possibly accompanied by a change of internal configuration. Turing argued that the class of functions calculable by means of an algorithmic procedure (a mechanical, stepwise, deterministic procedure) is to be identified with the class of functions computable by Turing machines. The epistemological significance of Turing machines and related mathematical results hinges upon this identification, which later became known as Turing's thesis; an equivalent claim, Church's thesis, had been advanced independently by Alonzo Church. Most crucially, mathematical results stating that certain functions cannot be computed by any Turing machine are interpreted, by Turing's thesis, as establishing absolute limitations of computing agents.

TYPES, THEORY OF

See Theory of types

TYPE/TOKEN DISTINCTION

The type/token distinction is related to that between universals and particulars. C.S. Peirce introduced the terms 'type' and 'token', and illustrated the distinction by pointing to two senses of 'word': in one, there is only one word 'the' in the English language; in the other, there are numerous words 'the' on the physical page you are now looking at. The latter are spatiotemporal objects composed of ink; they are said to be word tokens of the former, which is said to be the word type and is abstract. Phonemes, letters and sentences also come in types and tokens.

UNCONSCIOUS MENTAL STATES

Unconscious phenomena are those mental phenomena which their possessor cannot introspect, not only at the moment at which the phenomenon occurs, but even when prompted ('Do you think/want/ . . . ?'). There are abundant allusions to many kinds of unconscious phenomena from classical times to Freud. Most notably, Plato in his *Meno* defended a doctrine of *anamnesis* according to which a priori knowledge of, for example, geometry is 'recollected' from a previous life. But the notion of a rich, unconscious mental life really takes hold in nineteenth-century writers such as Herder, Hegel, Helmholtz and Schopenhauer. It is partly out of this latter tradition that Freud's famous postulations of unconscious, 'repressed' desires and memories emerged.

Partly in reaction to the excesses of introspection and partly because of the rise of computational models of mental processes, twentieth-century psychology has often been tempted by Lashley's view that 'no activity of mind is ever conscious'. A wide range of recent experiments do suggest that people can be unaware of a multitude of sensory cognitive factors (for example, pupillary dilation, cognitive dissonance, subliminal cues to problem-solving) that demonstrably affect their behaviour. And Weiskrantz has documented cases of 'blindsight' in which patients with damage to their visual cortex can be shown to be sensitive to visual material they sincerely claim they cannot see.

The most controversial cases of unconscious phenomena are those which the agent could not possibly introspect, even in principle. Chomsky ascribes unconscious knowledge of quite abstract principles of grammar to adults and even newborn children that only a linguist could infer.

Many philosophers have found these claims about the unconscious unconvincing, even incoherent. However, they need to show how the evidence cited above could be otherwise explained, and why appeals to the unconscious have seemed so perfectly intelligible throughout history.

GEORGES REY

UNDERDETERMINATION

The term underdetermination refers to a broad family of arguments about the relations between theory and evidence. All share the conclusion that evidence is more or less impotent to guide choice between rival theories or hypotheses. In one or other of its guises, underdetermination has probably been the most potent and most pervasive idea driving twentieth-century forms of scepticism and epistemological relativism. It figures prominently in the writing of diverse influential philosophers. It is a complex family of doctrines, each with a different argumentative structure. Most, however, suppose that only the logical consequences of an hypothesis are relevant to its empirical support. This supposition can be challenged.

LARRY LAUDAN

UNITY OF SCIENCE

How should our scientific knowledge be organized? Is scientific knowledge unified and, if so, does it mirror a unity of the world as a whole? Or is it merely a matter of simplicity and economy of thought? Either way, what sort of unity is it? If the world can be decomposed into elementary constituents, must our knowledge be in some way reducible to, or even replaced by, the concepts and theories describing such constituents? Can economics be reduced to microphysics, as Einstein claimed? Can sociology be derived from molecular genetics? Might the sciences be unified in the sense of all

following the same method, whether or not they are all ultimately reducible to physics? Considerations of the unity problem begin at least with Greek cosmology and the question of the one and the many. In the late twentieth century the increasing tendency is to argue for the disunity of science and to deny reducibility to physics.

JORDI CAT

UNIVERSALISM IN ETHICS

The claim that ethical standards or principles are universal is an ancient commonplace of many ethical traditions and of contemporary political life, particularly in appeals to universal human rights. Yet it remains controversial. There are many sources of controversy. Universalism in ethics may be identified with claims about the form, scope or content of ethical principles, or with the very idea that ethical judgment appeals to principles, rather than to particular cases. Or it may be identified with various claims to identify a single fundamental universal principle, from which all other ethical principles and judgments derive. These disagreements can be clarified, and perhaps in part resolved, by distinguishing a number of different conceptions of universalism in ethics.

ONORA O'NEILL

UNIVERSALS

Introduction

In metaphysics, the term 'universals' is applied to things of two sorts: properties (such as redness or roundness), and relations (such as kinship relations like sisterhood, or the causal relation, or spatial and temporal relations). Universals are to be understood by contrast with particulars. Few universals, if any, are truly 'universal' in the sense that they are shared by all individuals – a universal is characteristically the sort of thing which some individuals may have in common, and others may lack.

Universals have been conceived to be things which enable us intellectually to grasp a permanent, underlying order behind the changing flux of experience. Some of the gods of ancient mythologies correspond roughly to various important underlying universals – social relations for instance, as for example if Hera is said to be the goddess of Marriage and Ares (or Mars) is said to be the god of War. Many traditions, East and West, have dealt with the underlying problem which generates theories of universals; nevertheless the term 'universals' is closely tied to the Western tradition, and the agenda has been set largely by the work of Plato and Aristotle.

The term often used in connection with Plato is not 'universals' but 'Forms' (or 'Ideas', used in the sense of ideals rather than of thoughts), the term 'universals' echoing Aristotle more than Plato. Other terms cognate with universals include not only properties and relations, but also qualities, attributes, characteristics, essences and accidents (in the sense of qualities which a thing has not of necessity but only by accident), species and genus, and natural kinds.

Various arguments have been advanced to establish the existence of universals, the most memorable of which is the 'one over many' argument. There are also various arguments against the existence of universals. There are, for instance, various vicious regress arguments which derive from Aristotle's so-called 'third man argument' against Plato. Another family of arguments trades on what is called Ockham's razor: it is argued that we can say anything we need to say, and explain everything we need to explain, without appeal to universals; and if we can, and if we are rational, then we should. Those who believe in universals are called Realists, those who do not are called Nominalists.

1 Sources in ancient mathematics and biology

Plato looked to mathematics as a model to find ideal 'Forms' which can be grasped by the intellect and which we find to be imperfectly reflected in the world of the senses. Moral and political ideals too, Plato thought, are reflected only very imperfectly in the world of appearances. Aristotle's conception of universals was tailored to fit not mathematics but biology. Individual animals and plants fall into natural kinds, or species, such as pigs or cabbages. Various different species, in turn, fall under a genus.

Universals impose a taxonomy on the plurality of different individuals in the world. Regularities in the world can then be understood by appeal to the universals, or species, under which individuals fall, explaining why pigs never give birth to kittens, for

instance, and in general why each living thing generates others of its kind.

Plato conceived of universals as transcendent beings, *ante rem* in Latin ('before things'): the existence of universals does not depend on the existence of individuals which instantiated them. This is a natural thought if your model of universals lies in mathematics: geometrical truths about circles, for instance, do not depend on the existence of any individuals which really are perfectly circular. Aristotle, in contrast, held a theory of universals as immanent beings, *in rebus* ('in things'): there can be no universals unless there are individuals in which those universals are instantiated. This is a natural thought if your model of universals lies in biology: a species cannot exist, for instance, if there are no animals of that species. Thus, one of the key distinctions between Plato's transcendent and Aristotle's immanent realism is that the Platonist allows, and Aristotle does not allow, the existence of uninstantiated universals (see Aristotle §15; Plato).

2 Samenesses and differences

When a property is shared by two individuals, there is something which is in or is had by both. But it is in a quite distinctive sense that one universal can be 'in' two distinct individuals. An individual person may be 'in' two places at once if, for instance, their hand is in the cookie jar and their foot is in the bath. But a universal is 'in' distinct individuals in a way which does not mean that there is one part of the universal in one thing and a distinct part of it in another. Thus, a universal is said to be the sort of thing which can be wholly present in distinct individuals at the same time: a person cannot be wholly present in two places at once, but justice can.

Some draw a distinction between certain special properties and relations which qualify for the label 'universals', and other properties and relations which do not. It is suggested that, whenever something is true of an individual (whenever a description can truly be predicated of an individual), then there is always a 'property' which that individual may be said to have. On this view, a 'property' is just a shadow of a predicate, whereas a genuine universal is something more. A genuine universal has to be something which is literally identical in each of its instances. Alternatively, the sorts of 'properties' which are just shadows of predicates are sometimes construed as set-theoretical constructions of various sorts, as for instance if we say that the 'property' of redness is the set of actual red things, or of actual and possible red things. In this spirit it is now standard practice in mathematics to use the term 'relations' to refer just to any set of ordered pairs. Set-theoretical constructions are not, however, universals – or at least they are not to be confused with the universals which are the subject matter of traditional debates.

3 Arguments for and against

Various arguments have been advanced to establish the existence of universals, the most memorable of which is the 'one over many' argument. Although it is memorable, there is little consensus on just how this argument works. Very roughly, it begins with an appeal to the manifest fact of recurrence, the fact that, as it says in the biblical text of *Ecclesiastes* (1: 9), 'What has been is what will be, and what has been done is what will be done; and there is nothing new under the sun'. There are many things, and yet they are all in some sense just the very same things over and over again. From this manifest fact of recurrence, the argument purports to derive the conclusion that there are universals as well as particulars.

There are also various arguments against the existence of universals. One family of such arguments derives from Aristotle's so-called 'third man argument' and is designed to demonstrate that Plato's theory of Forms entails an unacceptable infinite regress. Roughly, Plato's problem is that he needs some relation to hold between the Form of Man and individual men before this Form can help to explain what it is that individual men have in common. So the theory would seem to call into being another Form, a third man, which is what the Form of Man has in common with individual men. This leads to an infinite regress, hence Plato's theory of Forms is unacceptable. Of course, Aristotle had only intended to demonstrate the non-existence of Plato's Forms, not of universals in general; but enemies of universals frequently advance related infinite-regress arguments against the existence of universals of any kind. Whatever you call the instantiation relation between particulars and universals, if you think of it as another universal then you are off on a regress, and this seems to count against any theory of universals.

Another argument against the existence of universals trades on what is called 'Ockham's razor' – the principle that you should not postulate more entities when everything you want to explain can be explained using fewer (see William of Ockham). It is sometimes argued that everything you can explain with universals can be explained just as well without them. Things which superficially seem to refer to universals can, it is maintained, generally be rephrased in ways which make no apparent reference to universals – reference to universals can be paraphrased away. If we can do

without universals, then obviously we should; when you supplement this Ockhamist argument with allusions to the interminable and unresolvable internecine conflicts among Realists over numerous details, you have an even stronger case against the existence of universals.

4 Nominalism and Realism

During the Middle Ages in Europe, universals played a focal role in the intellectual economy: many issues revolved around what became known as the problem of universals. Famously, a commentary by BOETHIUS on Porphyry's *Isagoge*, which in turn was intended as an introduction to Aristotle's Categories, set very crisply but vividly and tantalizingly what came to be taken as a compulsory question in the medieval pursuit of learning: whether genera and species are substances or are set in the mind alone; whether they are corporeal or incorporeal substances; and whether they are separate from the things perceived by the senses or set in them (Boethius *c.*510; Spade 1994). The initial problem for many was not one of deciding whether there are any universals, but of choosing between Plato and Aristotle and then fine-tuning further details.

Later in the Middle Ages, however, a growing number of philosophers and theologians became more and more impressed by arguments against the existence of universals. They began to adopt the position called 'Nominalism' which was opposed to all the various forms of Platonic or Aristotelian Realism. According to Nominalists like ABELARD and Ockham, the only thing which distinct individuals share is a common name, a label which we choose to apply to each of those individuals and not to others.

Nominalistic claims were echoed by many of the champions of the modern sciences as they emerged at the end of the Middle Ages. It was standardly said to be granted on all hands that all existing things are merely particular. Being assumed as granted on all hands, it was not up for debate, and so the problem of universals, explicitly so described, settled into the shadowy background of scientific and philosophical discussion. For example, an archaeologist of ideas might argue that, in Kant, the problem of universals is really alive and working very hard in the background, playing a role in discussions on almost every topic that arises. Nonetheless the problem of universals, under that name or any clear equivalent, is not featured on Kant's explicit agenda. Kant speaks of intuitions and concepts in ways which have some relation to the old problem of particulars and universals, but more has shifted than just the labels. Hence the problem of universals has received little attention across a great span of philosophical history, right through to twentieth-century philosophy in France and Germany (see NOMINALISM; REALISM AND ANTIREALISM).

5 Frege exhumes universals

In the twentieth century, the problem of universals has re-emerged under its familiar name, accompanied by more or less the same guiding illustrations used by Plato and Aristotle. This rebirth has occurred in the tradition of analytic philosophy, notably in the work of FREGE, RUSSELL, WITTGENSTEIN, QUINE and Armstrong.

A new twist to the theory of universals can be traced to groundbreaking work by Frege on the nature of natural numbers in his *Die Grundlagen der Arithmetik* (The Foundations of Arithmetic) (1884). As for Plato, so too for Frege, Russell and others in recent times, advances in mathematics have been the source of a philosophical focus on the problem of universals. Frege's analysis of natural numbers (1, 2, 3, . . .) proceeded in three very different stages (see FREGE, G. §9).

In the first stage of his analysis of numbers, Frege introduced the idea that numbering individuals essentially involves not the attribution of properties to individuals but, rather, the attribution of properties to properties. To illustrate: when asked 'How many are on the table?', Frege notes that there will be many different possible answers, as for instance (1) 'Two packs of playing cards' or (2) '104 playing cards'. The metaphysical truth-makers identified by Frege for these two sample answers are (1) that the property of being a pack of playing cards on the table is a property which has the property of having two instances, and (2) that the property of being a playing card on the table is a property which has the property of having one hundred and four instances. In general, natural numbers number individuals only via the intermediary of contributing to second-order properties, or properties of properties, namely properties of the form 'having *n* instances'. Like Kant, Frege speaks of concepts (*Begriffe*) rather than of 'universals'. Yet Frege's concepts are definitively not private mental episodes, but are thoroughly mind-independent, more like Plato's Forms than Aristotelian universals.

In the second stage of his analysis of numbers, Frege gives a very new twist to the theory of universals. He argues that the nature of universals, or concepts, is such as to make it impossible in principle ever to refer to a universal by any name or description. Thus for instance, in saying 'Socrates is wise', the universal which is instantiated by Socrates is something which is expressed by the whole arrangement of symbols into which the name

'Socrates' is embedded to yield the sentence 'Socrates is wise'. Suppose you were to try to name this universal by the name 'wisdom'. Then, compare 'Socrates is wise' with the concatenation of names – 'Socrates wisdom'. The mere name 'wisdom' clearly leaves out something which was present in the attribution of wisdom to Socrates. Hence a universal cannot be referred to by a name.

Thus, a property can only be expressed by a predicate, never by a name or by any logical device which refers to individuals. Indeed, if we wish to attribute existence to universals, we cannot do so by the use of the same sort of device (the first-order quantifier) as that used to attribute existence to individuals. Thus, for instance, from 'Socrates is wise' we may infer 'There exists something which is wise', and 'There exists something which is Socrates':

$$(\exists x)(\text{wise}(x)), \text{ and}$$
$$(\exists x)(x = \text{Socrates}).$$

Yet we may not infer that 'There exists something which Socrates possesses', or that 'There exists something which is wisdom':

$$(\exists x)(\text{has}(\text{Socrates}, x)), \text{ or}$$
$$(\exists x)(x = \text{wisdom}).$$

Frege does, however, allow us to attribute existence to universals, using logical devices called higher-order quantifiers, which he introduced in his *Begriffsschrift* (1879). That is, we can infer from 'Socrates is wise' to 'There is somehow such that: Socrates is that-how':

$$(\mathrm{E}f)(f(\text{Socrates})).$$

But although there is somehow that Socrates is, this does not entail that there is anything which is the somehow that Socrates is: universals (concepts) can only have second-order existence, not first-order existence.

For Frege, numbering things essentially involved attribution of properties to properties. So the sorts of things being attributed are not the sorts of things which can be named. Yet, Frege argued, numbers can be named – numbers are abstract individuals, he says, objects not concepts. Hence the third stage of Frege's analysis of numbers consists in the attempt to find individuals – objects – which could be identified with the numbers. It was this stage of the analysis which resulted in the emergence of modern set theory. For every property, Frege argued, there is a corresponding individual: the extension of that universal, the set of all the things (or all the actual and possible things) which instantiate that universal. Thus, for instance, corresponding to the property of being a property which has two instances, there will be a set of sets which have two members. Modern mathematics has selected different candidates for identification with the natural numbers, but it has followed Frege hook, line and sinker with respect to the broad strategy of identifying numbers, and functions and relations, with sets.

Frege's legacy has significantly changed the agenda for any theory of universals which, like Plato's, aspires to do justice to mathematics. It leaves three courses open for exploration. One course is that charted by Quine, of allowing the existence of sets but not of any other nameable things which might be called universals, nor of any of Frege's higher-order, unnameable universals. Another course is that of allowing the existence of nameable things other than sets: this is a course charted, for example, by Armstrong (1978). A third course allows also the irreducible significance of higher-order quantification.

USE/MENTION DISTINCTION AND QUOTATION

Speakers 'use' the expressions they utter and 'mention' the individuals they talk about. Connected with the roles of used expressions and mentioned individuals is a way of uniting them and a characteristic mistake involving them. Usually the expression used in an utterance will not be the same as the individual mentioned, but the two can be made to converge. The means is quotation. Quotation is a special usage in which an expression is used to mention itself. A failure to distinguish between the roles of used expressions and mentioned individuals can lead to mistakes. Such mistakes are called use/mention confusions. In themselves use/mention confusions are a minor linguistic *faux pas*,

but under unfavourable conditions, they have the potential to cause greater problems.

UTILITARIANISM

Introduction

Utilitarianism is a theory about rightness, according to which the only good thing is welfare (wellbeing or 'utility'). Welfare should, in some way, be maximized, and agents are to be neutral between their own welfare, and that of other people and of other sentient beings.

The roots of utilitarianism lie in ancient thought. Traditionally, welfare has been seen as the greatest balance of pleasure over pain, a view discussed in Plato. The notion of impartiality also has its roots in Plato, as well as in Stoicism and Christianity. In the modern period, utilitarianism grew out of the Enlightenment, its two major proponents being Jeremy Bentham and John Stuart Mill.

Hedonists, believing that pleasure is the good, have long been criticized for sensualism, a charge Mill attempted to answer with a distinction between higher and lower pleasures. He contended that welfare consists in the experiencing of pleasurable mental states, suggesting, in contrast to Bentham, that the quality, not simply the amount, of a pleasure is what matters. Others have doubted this conception, and developed desire accounts, according to which welfare lies in the satisfaction of desire. Ideal theorists suggest that certain things are just good or bad for people, independently of pleasure and desire.

Utilitarianism has usually focused on actions. The most common form is act-utilitarianism, according to which what makes an action right is its maximizing total or average utility. Some, however, have argued that constantly attempting to put utilitarianism into practice could be self-defeating, in that utility would not be maximized by so doing. Many utilitarians have therefore advocated non-utilitarian decision procedures, often based on common-sense morality. Some have felt the appeal of common sense moral principles in themselves, and sought to reconcile utilitarianism with them. According to rule-utilitarianism, the right action is that which is consistent with those rules which would maximize utility if all accepted them.

There have been many arguments for utilitarianism, the most common being an appeal to reflective belief or 'intuition'. One of the most interesting is Henry Sidgwick's argument, which is ultimately intuitionist, and results from sustained reflection on common sense morality. The most famous argument is Mill's 'proof'. In recent times, R.M. Hare has offered a logical argument for utilitarianism.

The main problems for utilitarianism emerge out of its conflict with common sense morality, in particular justice, and its impartial conception of practical reasoning.

1 Introduction and history

Defining utilitarianism is difficult, partly because of its many variations and complexities, but also because the utilitarian tradition has always seen itself as a broad church. But before offering a history, we must supply a working definition. First, utilitarianism is, usually, a version of *welfarism*, the view that the only good is welfare (see WELFARE). Second, it assumes that we can compare welfare across different people's lives (see ECONOMICS AND ETHICS). Third, it is a version of consequentialism (see CONSEQUENTIALISM). Consequentialists advocate the impartial maximization of certain values, which might include, say, equality. Utilitarianism is welfarist consequentialism, in its classical form, for instance, requiring that any action produce the greatest happiness (see HAPPINESS).

The concern with welfare, its measurement and its maximization is found early, in Plato's *Protagoras*. In the process of attempting to prove that all virtues are one, Socrates advocates hedonism, the welfarist view that only pleasurable states of mind are valuable, and that they are valuable solely because of their pleasurableness (see PLATO §9; SOCRATES; HEDONISM).

The debate in the *Protagoras* is just one example of the many discussions of welfare in ancient ethics (see EUDAIMONIA). Some have seen Greek ethics as primarily egoistic, addressing the question of what each individual should do to further their own welfare (see EGOISM AND ALTRUISM §4). Utilitarianism, however, is impartial.

The Stoics, who followed Plato and Aristotle, began to develop a notion of impartiality according to which self-concern extended rationally to others, and eventually to the whole world (see STOICISM). This doctrine, allied to Christian conceptions of self-sacrifice, and conceptions of rationality with roots in Plato which emphasize the objective

supra-individual point of view, could plausibly be said to be the source of utilitarian impartiality (see IMPARTIALITY).

In the modern period, the history of utilitarianism takes up again during the Enlightenment. The idea of impartial maximization is found in the work of the eighteenth-century Scottish philosopher Francis HUTCHESON. The work of his contemporary, David Hume, also stressed the importance to ethics of the notion of 'utility' (see HUME, D. §4). A little later, the so-called 'theological utilitarians', Joseph Priestley and William PALEY, argued that God requires us to promote the greatest happiness. Meanwhile, in France, Claude Helvétius advocated utilitarianism as a political theory, according to which the task of governments is to produce happiness for the people. He influenced one of the most extreme of all utilitarians, William Godwin.

It was Jeremy BENTHAM, however, who did most to systematize utilitarianism. Bentham's disciple, J.S. MILL, was the next great utilitarian, and he was followed by Henry SIDGWICK. G.E. MOORE distanced himself from Mill's hedonism, and offered an influential 'ideal' account of the good. One of the most important recent versions of utilitarianism is that of R.M. Hare.

2 Conceptions of utility

Before you can maximize utility, you need to know what utility is. It is essential to note that the plausibility of utilitarianism as a theory of right action does not depend on any particular conception of welfare. An account of the good for a person is different from an account of right action (see RIGHT AND GOOD).

Utilitarians have held many different views of utility. The 'classical' utilitarians – primarily Bentham and Mill – were hedonists. There are many objections to hedonism. What about masochists, for example, who seem to find pain desirable? Well, perhaps pain can be pleasurable. But is there really something common – pleasure – to all the experiences that go to make up a happy life? And would it be rational to plug oneself into a machine that gave one vast numbers of pleasurable sensations? Here there may be a move towards the more eclectic view of Sidgwick, that utility consists in desirable consciousness of any kind. Some philosophers, however, such as Nietzsche, have suggested that a life of mere enjoyment is inauthentic.

Hedonists have been criticized for sensualism. For millennia J.S. Mill sought to answer the charge, suggesting that hedonists do not have to accept that all pleasurable experiences – drinking lemonade and reading Wordsworth – are on a par, to be valued only according to the *amount* of pleasure they contain. Bentham and others had suggested that the value of a pleasure depends mainly on its intensity and its duration, but Mill insisted that the *quality* of a pleasure – its nature – also influences its pleasurableness, and hence its value. But why must the effect on value of the nature of an experience be filtered through pleasurableness? Why cannot its nature by itself add value?

Perhaps the most serious objection to any theory that welfare consists in mental states is the so-called 'experience machine'. This machine is better than the pleasure machine, and can give you the most desirable experiences you can imagine. Would it be best for you to be wired up to it throughout your life? Note that this is not the question whether it would be *right* to arrange for yourself to be wired up, leaving all your obligations in the real world unfulfilled. Even a utilitarian can argue that that would be immoral.

Some people think it makes sense to plug in, others that it would be a kind of death. If you are one of the latter, then you might consider moving to a desire theory of utility, according to which what makes life good for you is your desires being maximally fulfilled. On the experience machine, many of your desires will remain unfulfilled. You want not just the experience of, say, bringing about world peace, but actually to bring it about. Desire theories have come to dominate contemporary thought because of economists' liking for the notion of 'revealed preferences' (see RATIONALITY, PRACTICAL). Pleasures and pains are hard to get at or measure, whereas people's preferences can be stated, and inferred objectively from their behaviour.

A simple desire theory fails immediately. I desire the glass of liquid, thinking it to be whisky. In fact it is poison, so satisfying my desire will not make me better off. What desire theorists should say here is that it is the satisfaction of intrinsic desires which counts for wellbeing. My intrinsic desire is for pleasure, the desire for the drink being merely derived.

The usual strategy adopted by desire theorists is to build constraints into the theory in response to such counterexamples: what makes me better off is not the fulfilment of my desires, but of my informed desires.

But why do desire theorists so respond to such counterexamples? It is probably because they already have a view of utility which guides them in the construction of their theories. This means that desire theories are themselves idle, which is to be expected once we realize that the fulfilment of a desire is in itself neither good nor bad for a person. What matters is whether what the person desires, and gets, is good or bad.

For reasons such as this, there is now a return to ancient *ideal* theories of utility, according to which certain things are good or bad for beings, independently in at least some cases of whether they are desired or whether they give rise to pleasurable experiences. Another interesting ancient view which has recently been revived is that certain non-hedonistic goods are valuable, but only when they are combined with pleasure or desire-fulfilment (see Plato, *Philebus* 21a–22b). The non-hedonistic goods suggested include knowledge and friendship. Questions to ask of the ideal theorist include the following. What will go on your list of goods? How do you decide? How are the various items to be balanced?

3 Types of utilitarianism

Theories of right and wrong have to be about something, that is, have to have a focus. Usually, at least in recent centuries, they have focused on actions, attempting to answer the questions, 'Which actions are right?', and 'What makes those actions right?' The ancients also asked these questions, but were concerned to focus on lives, characters, dispositions and virtues. Nearly all forms of utilitarianism have focused on actions, but in recent decades there has been some interest in utilitarianism as applied to motives, virtues and lives as a whole.

Utilitarianism is a form of consequentialism. But it is important to note that, since utilitarians can attach intrinsic moral importance to acts (especially, of course, to the act of maximizing itself), there are problems in attempting to capture the nature of utilitarianism using the act/consequence distinction. A recent alternative has been to employ the 'agent-neutral'/'agent-relative' distinction. Agent-neutral theories give every agent the same aim (for example, that utility be maximized), whereas agent-relative theories give agents different aims (say, that *your* children be looked after). Logically, however, there is nothing to prevent a utilitarian from insisting that *your* aim should be that *you* maximize utility. Though this theory would be practically equivalent to an agent-neutral theory, its possibility suggests there may be problems with attempting to use the agent-neutral/agent-relative distinction to capture the essence of utilitarianism.

What clearly distinguishes utilitarianism from other moral theories is what it requires and why, so we should now turn to that. The commonest, and most straightforward, version of utilitarianism is *act-utilitarianism*, according to which the criterion of an action's rightness is that it maximize utility.

Act-utilitarians might offer two accounts of rightness. The objectively right action would be that which actually does maximize utility, while the subjectively right action would be that which maximizes expected utility. Agents would usually be blamed for not doing what was subjectively right.

Another distinction is between *total* and *average* forms. According to the total view, the right act is the one that produces the largest overall total of utility. The average view says that the right action is that which maximizes the average level of utility in a population. These theories are inconsistent only in cases in which the size of a population is under consideration. The most common such case occurs when one is thinking of having a child. Here, the average view has the absurd conclusion that I should not have a child, even if its life will be wonderful and there will be no detrimental effects from its existence, if its welfare will be lower than the existing average.

But the total view also runs into problems, most famously with Derek Parfit's 'repugnant conclusion', which commits the total view to the notion that if a population of people with lives barely worth living is large enough it is preferable to a smaller population with very good lives. One way out of this problem is to adopt a *person-affecting* version of utilitarianism, which restricts itself in scope to existing people. But there are problems with this view. Recently, certain writers have suggested that one way to avoid the 'repugnant conclusion' would be to argue that there are *discontinuities* in value, such that once welfare drops below a certain level the loss cannot be compensated for by quantity. There is a link here with Mill's view of the relation of higher pleasures to lower.

Imagine being an act-utilitarian, brought up in an entirely act-utilitarian society. You will have to spend much time calculating the utility values of the various actions open to you. You are quite likely to make mistakes, and, being human, to cook the books in your own favour.

For these reasons, most act-utilitarians have argued that we should not attempt to put act-utilitarianism into practice wholesale, but stick by a lot of common sense morality. It will save a lot of valuable time, is based on long experience, and will keep us on the straight and narrow. Act-utilitarians who recommend sole and constant application of their theory as well as those who recommend that we never consult the theory and use common sense morality can both be called *single-level* theorists, since moral thinking will be carried on only at one level. Most utilitarians have adopted a *two-level* theory, according to which we consult utilitarianism only sometimes – in particular when the principles of ordinary morality conflict with one another.

The main problem with two-level views is their psychology. If I really accept utilitarianism, how can

I abide by a common sense morality I know to be a fiction? And if I really do take that common sense morality seriously, how can I just forget it when I am supposed to think as a utilitarian? The two-level response here must be that this is indeed a messy compromise, but one made to deal with a messy reality.

Act-utilitarianism is an extremely demanding theory, since it requires you to be entirely impartial between your own interests, the interests of those you love, and the interests of all. The usual example offered is famine relief. By giving up all your time, money and energy to famine relief, you will save many lives and prevent much suffering. Utilitarians often claim at this point that there are limits to human capabilities, and utilitarianism requires us only to do what we can. But the sense of 'can' here is quite obscure, since in any ordinary sense I can give up my job and spend my life campaigning for Oxfam.

The demandingness objection seems particularly serious when taken in the context of widespread non-compliance with the demands of act-utilitarian morality. Most people do little or nothing for the developing world, and this is why the moral demands on me are so great. An argument such as this has been used to advocate *rule-utilitarianism*, according to which the right action is that which is in accord with that set of rules which, if generally or universally accepted, would maximize utility. (The version of the theory which speaks of the rules that are *obeyed* is likely to collapse into act-utilitarianism.)

Unlike act-utilitarianism, which is a *direct* theory in that the rightness and wrongness of acts depends directly on whether they fit with the maximizing principle, rule-utilitarianism is an *indirect* theory, since rightness and wrongness depend on rules, the justification for which itself rests on the utilitarian principle.

The demandingness of act-utilitarianism has not been the main reason for adopting rule-utilitarianism. Rather, the latter theory has been thought to provide support for common sense moral principles, such as those speaking against killing or lying, which appear plausible in their own right.

Rule-utilitarianism has not received as much attention as act-utilitarianism, partly because it detaches itself from the attractiveness of maximization. According to rule-utilitarianism there may be times when the right action is to bring about less than the best possible world (such as when others are not complying). But if maximization is reasonable at the level of rules, why does it not apply straightforwardly to acts?

4 Arguments for utilitarianism

The most famous argument for utilitarianism is John Stuart Mill's 'proof'. This has three stages:

(1) Happiness is desirable.
(2) The general happiness is desirable.
(3) Nothing other than happiness is desirable.

Each stage has been subjected to much criticism, especially the first. Mill was an empiricist, who believed that matters of fact could be decided by appeal to the senses (see Empiricism). In his proof, he attempted to ground evaluative claims on an analogous appeal to desires, making unfortunate rhetorical use of 'visible' and 'desirable'. The first stage suggests to the reader that if they consult their own desires, they will see that they find happiness desirable.

The second stage is little more than assertion, since Mill did not see the vastness of the difference between egoistic and universalistic hedonism (utilitarianism). In an important footnote (1861: ch. 5, para. 36), we see the assumption that lies behind the proof: the more happiness one can promote by a certain action, the stronger the reason to perform it. Egoists will deny this, but it does put the ball back in their court.

The final stage again rests on introspection, the claim being that we desire, ultimately, only pleasurable states. Thus even a desire for virtue can be seen as a desire for happiness, since what we desire is the pleasure of acting virtuously or contemplating our virtue. One suspects that introspection by Mill's opponents would have had different results.

Perhaps the most common form of utilitarianism, as of any other moral theory, is, in a weak sense, intuitionist. To many, utilitarianism has just seemed, taken by itself, reasonable – so reasonable, indeed, that any attempt to prove it would probably rest on premises less secure than the conclusion. This view was expressed most powerfully by Henry Sidgwick. Sidgwick supported his argument with a painstaking analysis of common sense morality. Sidgwick also believed that egoism was supported by intuition, so that practical reason was ultimately divided (see Egoism and altruism §§1, 3).

In the twentieth century, R.M. Hare wished to avoid appeal to moral intuition, which he saw as irrational. According to Hare, if we are going to answer a moral question such as, 'What ought I to do?', we should first understand the logic of the words we are using. In the case of 'ought', we shall find that it has two properties: prescriptivity (it is action-guiding) and universalizability (I should be ready to assent to any moral judgment I make when it is applied to situations similar to the present one in their universal properties) (see Prescriptivism). Hare argues that putting yourself in another's position properly – 'universalizing' – involves taking on board their preferences. Once this has been

done, the only rational strategy is to maximize overall preference-satisfaction, which is equivalent to utilitarianism.

Hare's moral theory is one of the most sophisticated since Kant's, and he does indeed claim to incorporate elements of Kantianism into his theory (see KANTIAN ETHICS). Objectors have claimed, however, that, rather like Kant himself, Hare introduces 'intuitions' (that is, beliefs about morality or rationality) through the back door. For example, the logic of the word 'ought' may be said not to involve a commitment to the rationality of maximization even in one's own case.

5 Problems for utilitarianism

There are many technical problems with the various forms of utilitarianism. How are pleasure and pain to be measured? Which desires are to count? Is knowledge a good in itself? Should we take into account actual or probable effects on happiness? How do we characterize the possible world which is to guide us in our selection of rules? These are problems for the theorists themselves, and there has been a great deal said in attempts to resolve them.

More foundational, however, is a set of problems for any kind of utilitarian theory, emerging out of utilitarianism's peculiarly strict conception of impartiality. A famous utilitarian tag, from Bentham, is, 'Everybody to count for one, nobody for more than one'. This, however, as Mill implies (1861: ch. 5, para. 36), is slightly misleading. In a sense, according to utilitarianism, no one matters; all that matters is the level of utility. What are counted equally are not persons but pleasures or utilities.

This conception of impartiality has made it easy for opponents of utilitarianism to dream up examples in which utilitarianism seems to require something appalling. A famous such example requires a utilitarian sheriff to hang an innocent man, so as to prevent a riot and bring about the greatest overall happiness possible in the circumstances (see CRIME AND PUNISHMENT §2).

Utilitarians can here respond that, in practice, they believe that people should abide by common sense morality, that people should accept practical principles of rights for utilitarian reasons (see §2). But this misses the serious point in many of these objections: that it matters not just how much utility there is, but how it is shared around. Imagine, for example, a case in which you can give a bundle of resources either to someone who is well-off and rich through no fault of their own, or to someone who is poor through no fault of their own. If the utility of giving the bundle to the rich person is only slightly higher than that of giving it to the poor person, utilitarianism dictates giving it to the rich person. But many (including some consequentialists) would argue that it is reasonable to give some priority to the worse-off.

These are problems at the level of the social distribution of utility. But difficulties arise also because of the fact that human agents each have their own lives to live, and engage in their practical reasoning from their own personal point of view rather than from the imaginary point of view of an 'impartial spectator'. These problems have been stated influentially in recent years by Bernard WILLIAMS, who puts them under the heading of what he calls 'integrity'.

In a famous example, Williams asks us to imagine the case of Jim, who is travelling in a South American jungle. He comes across a military firing squad, about to shoot twenty Indians from a nearby village where some insurrection has occurred. The captain in charge offers Jim a guest's privilege. Either Jim can choose to shoot one of the Indians himself, and the others will go free, or all twenty will be shot by the firing squad.

Williams' point here is not that utilitarianism gives the wrong answer; indeed he himself thinks that Jim should shoot. Rather, it is that utilitarianism reaches its answer too quickly, and cannot account for many of the thoughts we know that we should have ourselves in Jim's situation, such as, 'It is I who will be the killer'. Practical reasoning is not concerned only with arranging things so that the greatest utility is produced. Rather it matters to each agent what role they will be playing in the situation, and where the goods and bads occur. This point emerges even more starkly if we imagine a variation on the story about Jim, in which the captain asks Jim to commit suicide so as to set an example of courage and nobility to the local populace, on the condition that if he does so the twenty Indians will go free. The utility calculations are as clear, perhaps clearer, than in the original story. But it is only reasonable that Jim in this story should think it relevant that it is he who is going to die. To any individual, it matters not only how much happiness there is in the world, but who gets it.

UTOPIANISM

Utopianism is the general label for a number of different ways of dreaming or thinking about, describing or attempting to create a better society. Utopianism is derived from the word 'utopia', coined by Thomas MORE. In his book *Utopia* (1516) More described a society significantly better than England as it existed at the time, and the word *utopia* (good place) has come to mean a description of a fictional place, usually a society, that is better than the society in which the author lives and which functions as a criticism of the author's society. In some cases it is intended as a direction to be followed in social reform, or even, in a few instances, as a possible goal to be achieved.

The concept of utopianism clearly reflects its origins. In *Utopia* More presented a fictional debate over the nature of his creation. Was it fictional or real? Was the obvious satire aimed primarily at contemporary England or was it also aimed at the society described in the book? More important for later developments, was it naïvely unrealistic or did it present a social vision that, whether achievable or not, could serve as a goal to be aimed at? Most of what we now call utopianism derives from the last question. In the nineteenth century Robert Owen in England and Charles Fourier, Henri Saint-Simon and Étienne Cabet in France, collectively known as the utopian socialists, popularized the possibility of creating a better future through the establishment of small, experimental communities. Karl Marx, Friedrich Engels and others argued that such an approach was incapable of solving the problems of industrial society and the label 'utopian' came to mean unrealistic and naïve. Later theorists, both opposed to and supportive of utopianism, debated the desirability of depicting a better society as a way of achieving significant social change. In particular, Christian religious thinkers have been deeply divided over utopianism. Is the act of envisaging a better life on earth heretical, or is it a normal part of Christian thinking?

Since the collapse of communism in Eastern Europe and the former Soviet Union, a number of theorists have argued that utopianism has come to an end. It has not; utopias are still being written and intentional communities founded, in the hope that a better life is possible.

VAGUENESS

It seems obvious that there are vague ways of speaking and vague ways of thinking – saying that the weather is hot, for example. Common sense also has it that there is vagueness in the external world (although this is not the usual view in philosophy). Intuitively, clouds, for example, do not have sharp spatiotemporal boundaries. But the thesis that vagueness is real has spawned a number of deeply perplexing paradoxes and problems. There is no general agreement among philosophers about how to understand vagueness.

MICHAEL TYE

VAIHINGER, HANS (1852–1933)

Hans Vaihinger was a German philosopher and historian of philosophy. Much of his work was a response to Kant's philosophy, and he contributed to the revival of interest in Kant at the end of the nineteenth century both through his published commentaries and by founding a journal and society for the discussion of Kant's thought. He developed his own philosophy, the philosophy of 'as-if', which was derived from the Kantian notion of 'heuristic fictions'.

VEDĀNTA

Indian philosophical speculation burgeoned in texts called Upaniṣads (from 800 BC), where views about a true Self (*ātman*) in relation to Brahman, the supreme reality, the Absolute or God, are propounded and explored. Early Upaniṣads were appended to an even older sacred literature, the Veda ('Knowledge'), and became literally Vedānta, 'the Veda's last portion'. Classical systems of philosophy inspired by Upaniṣadic ideas also came to be known as Vedānta, as well as more recent spiritual thinking. Classical Vedānta is one of the great systems of Indian philosophy, extending almost two thousand years with hundreds of authors and several important subschools. In the modern period, Vedānta in the folk sense of spiritual thought deriving from Upaniṣads is a major cultural phenomenon.

Understood broadly, Vedānta may even be said to be the philosophy of Hinduism, although in the classical period there are other schools (notably Mīmāṃsā) that purport to articulate right views and conduct for what may be called a Hindu community (the terms 'Hindu' and 'Hinduism' gained currency only after the Muslim invasion of the South Asian subcontinent, beginning rather late in classical times). Swami Vivekananda (1863–1902), the great popularizer of Hindu ideas in the West, spoke of Vedānta as an umbrella philosophy of a Divine revealed diversely in the world's religious traditions. Such inclusivism is an important theme in some classical Vedānta, but there are also virulent disputes about how Brahman should be conceived, in particular Brahman's relation to the individual.

In the twentieth century, philosophers such as Sarvepalli Radhakrishnan, K.C. Bhattacharyya and T.M.P. Mahadevan have articulated idealist world-views largely inspired by classical and pre-classical Vedānta. The mystic philosopher Sri Aurobindo propounds a theism and evolutionary theory he calls Vedānta, and many others, including political leaders such as Gandhi and spiritual figures as

well as academics, have developed or defended Vedāntic views.

VICO, GIAMBATTISTA (1668–1744)

Vico lived in a period in which the successes of the natural sciences were frequently attributed to the Cartesian method of a priori demonstration. His own first interest, however, was in the cultivation of the humanist values of wisdom and prudence, to which this method was irrelevant. Initially, therefore, he sought a methodology for these values in the techniques of persuasion and argument used in political and legal oratory. But he soon came to believe that the Cartesian method was too limited to explain even the advances in the natural sciences and he developed an alternative constructivist theory of knowledge by which to establish the degree of certainty of the different sciences. Wisdom and prudence, however, came low on this scale.

Through certain historical studies in law, he became convinced that, although there were no eternal and universal standards underlying law at all times and places, the law appropriate to any specific historical age was dependent upon an underlying developmental pattern of social consciousness and institutions common to all nations except the Jews after the Fall. His *New Science* (1725, 1730 and 1744) was a highly original attempt to establish this pattern, originating in a primeval mythic consciousness and concluding in a fully rational, but ultimately corrupt, consciousness. He believed that knowledge of the pattern would enable us to interpret a wide range of historical evidence to provide continuous and coherent accounts of the histories of all actual gentile nations. The primacy of consciousness in the pattern led him to claim that there must be a necessary sequence of ideas upon which institutions rested, which would provide the key to the historical interpretation of meaning in all the different gentile languages. He supported this conception by extensive comparative anthropological, linguistic and historical enquiries, resulting most famously in his interpretation of the Homeric poems. He also advanced a more developed account of his earlier theory of knowledge, in which the work of philosopher and historian were mutually necessary, to show how this conception of 'scientific history' was to be achieved.

Vico believed that the knowledge that wisdom and prudence vary in different historical ages in accordance with an underlying pattern could provide us with a higher insight into those of our own age and enable us to avoid a collapse into barbarism which, in an overrational age in which religious belief must decline, was more or less inevitable. Unfortunately, the metaphysical status of his pattern rendered this impossible. Much of his thought was expressed in a context of theological assumptions which conflict with important aspects of his work. This has given rise to continuous controversy over his personal and theoretical commitment to these assumptions. Despite this, however, his conceptions of the historical development of societies, of the relation between ideas and institutions, of social anthropology, comparative linguistics and of the philosophical and methodological aspects of historical enquiry in general, remain profoundly fruitful.

LEON POMPA

VIENNA CIRCLE

The Vienna Circle was a group of about three dozen thinkers drawn from the natural and social sciences, logic and mathematics who met regularly in Vienna between the wars to discuss philosophy. The work of this group constitutes one of the most important and most influential philosophical achievements of the twentieth century, especially in the development of analytic philosophy and philosophy of science.

The Vienna Circle made its first public appearance in 1929 with the publication of its manifesto, *The Scientific Conception of the World: The Vienna Circle*. At the centre of this modernist movement was the so-called 'Schlick Circle', a discussion group organized in 1924 by the physics professor Moritz Schlick. Friedrich Waismann, Herbert Feigl, Rudolf Carnap, Hans Hahn, Philipp Frank, Otto Neurath, Viktor Kraft, Karl Menger, Kurt Gödel and Edgar Zilsel belonged to this inner circle. Their meetings in the Boltzmanngasse were also attended by Olga Taussky-Todd, Olga Hahn-Neurath, Felix Kaufmann, Rose Rand, Gustav Bergmann and Richard von Mises, and on some occasions by

visitors from abroad such as Hans Reichenbach, Alfred Ayer, Ernest Nagel, Willard Van Orman Quine and Alfred Tarski. This discussion circle was pluralistic and committed to the ideals of the Enlightenment. It was unified by the aim of making philosophy scientific with the help of modern logic on the basis of scientific and everyday experience. At the periphery of the Schlick Circle, and in a more or less strong osmotic contact with it, there were loose discussion groups around Ludwig Wittgenstein, Heinrich Gomperz, Richard von Mises and Karl Popper. In addition the mathematician Karl Menger established in the years 1926–36 an international mathematical colloquium, which was attended by Kurt Gödel, John von Neumann and Alfred Tarski among others.

Thus the years 1924–36 saw the development of an interdisciplinary movement whose purpose was to transform philosophy. Its public profile was provided by the Ernst Mach Society through which members of the Vienna Circle sought to popularize their ideas in the context of programmes for national education in Vienna. The general programme of the movement was reflected in its publications, such as the journal *Erkenntnis* ('Knowledge', later called The Journal for Unified Science), and the *International Encyclopedia of Unified Science*. Given this story of intellectual success, the fate of the Vienna Circle was tragic. The Ernst Mach Society was suspended in 1934 for political reasons, Moritz Schlick was murdered in 1936, and around this time many members of the Vienna Circle left Austria for racial and political reasons; thus soon after Schlick's death the Circle disintegrated. As a result of the emigration of so many of its members, however, the characteristic ideas of the Vienna Circle became more and more widely known, especially in Scandinavia, Britain and North America where they contributed to the emergence of modern philosophy of science. In Germany and Austria, however, the philosophical and mathematical scene was characterized by a prolongation of the break that was caused by the emigration of the members of the Vienna Circle.

VIOLENCE

Violence is a central concept for much discussion of moral and political life, but lots of debate employing the concept is confused by the lack of clarity about its meaning and about the moral status it should have in our development of public policy. Wide understandings of the term – for instance, structural violence – not only include too much under the name of violence, but also place an excessively negative moral loading onto the concept. This is also a problem for some other definitions of violence, such as legitimist definitions, which treat violence as essentially the illegitimate use of force. It is better to confront directly the important and disturbing claim that violence is sometimes morally permissible than to settle it by definitional fiat.

VIRTUE EPISTEMOLOGY

'Virtue epistemology' is the name of a class of theories that analyse fundamental epistemic concepts such as justification or knowledge in terms of properties of persons rather than properties of beliefs. Some of these theories make the basic concept constitutive of justification or knowledge that of a reliable belief-forming process, or a reliable belief-forming faculty or, alternatively, a properly functioning faculty. Others make the fundamental concept that of an epistemic or intellectual virtue in the sense of virtue used in ethics. In all these theories, epistemic evaluation rests on some virtuous quality of the person that enables them to act in a cognitively effective and commendable way, although not all use the term 'virtue'. The early, simple forms of process reliabilism are best treated as precursors to virtue epistemology since the latter arose out of the former and has added requirements for knowledge intended to capture the idea of epistemic behaviour that is subjectively responsible as well as objectively reliable.

Proponents of virtue epistemology claim a number of advantages. It is said to bypass disputes between foundationalists and coherentists on proper cognitive structure, to avoid sceptical worries, to avoid the impasse between internalism and externalism, and to broaden the range of epistemological inquiry in a way that permits the recovering of such neglected epistemic values as understanding and wisdom.

LINDA ZAGZEBSKI

VIRTUE ETHICS

Introduction

Virtue ethics has its origin in the ancient world, particularly in the writings of Plato and Aristotle. It

has been revived following an article by G.E.M. Anscombe critical of modern ethics and advocating a return to the virtues.

Some have argued that virtue ethics constitutes a third option in moral theory additional to utilitarianism and Kantianism. Utilitarians and Kantians have responded vigorously, plausibly claiming that their views already incorporate many of the theses allegedly peculiar to virtue ethics.

Virtue *theory*, the study of notions, such as character, related to the virtues, has led to the recultivation of barren areas. These include: What is the good life, and what part does virtue play in it? How stringent are the demands of morality? Are moral reasons independent of agents' particular concerns? Is moral rationality universal? Is morality to be captured in a set of rules, or is the sensitivity of a virtuous person central in ethics?

From virtue ethics, and the virtue theory of which it is a part, have emerged answers to these questions at once rooted in ancient views and yet distinctively modern.

1 Aristotle and ancient virtue ethics

Modern virtue ethicists often claim ARISTOTLE as an ancestor. Aristotle, however, was himself working through an agenda laid down by PLATO and SOCRATES. Socrates asked the question at the heart of Greek ethics: 'How should one live?' All three of these philosophers believed that the answer to this question is 'Virtuously' (see VIRTUES AND VICES §§1–3).

The ancient philosophical task was to show how living virtuously would be best for the virtuous person. Plato's *Republic* attempts to answer Thrasymachus' challenge that rational people will aim to get the most pleasure, honour and power for themselves. His argument is that justice, broadly construed, is to be identified with a rational ordering of one's soul. Once one sees that one identifies oneself with one's reason, one will realize that being just is in fact best for oneself. Thrasymachus, of course, might respond that he identifies himself with his desires.

Aristotle continued the same project, aiming to show that human *eudaimonia*, happiness, consists in the exercise (not the mere possession of) the virtues (see EUDAIMONIA; HAPPINESS). The linchpin of his case is his 'function' argument that human nature is perfected through virtue, a standard objection to which is that it confuses the notions of a good man and the good for man. Ultimately, Aristotle's method is similar to Plato's. Much of *Nicomachean Ethics* is taken up with portraits of the virtuous man intended to attract one to a life such as his.

For Aristotle, all of the 'practical' virtues will be possessed by the truly virtuous person, the man of 'practical wisdom' (Aristotle's central 'intellectual' virtue). Socrates believed that virtue was a *unity*, that it consisted in knowledge alone. Aristotle's position is one of *reciprocity*: the possession of one virtue implies the possession of all. At this point he joined Socrates and Plato in their opposition to Greek 'common sense'. This opposition to common sense is not something that characterizes modern virtue ethics.

2 Modern virtue theory

Virtue theory is that general area of philosophical inquiry concerned with or related to the virtues. It includes *virtue ethics*, a theory about how we should act or live. This distinction is a rough one, but it is important to grasp that much of modern virtue theory is by writers not themselves advocating virtue ethics.

Virtue theory has undergone a resurgence since G.E.M. Anscombe's article 'Modern Moral Philosophy' (1958) (see ANSCOMBE, G.E.M.). Anscombe believed that it was a mistake to seek a foundation for a morality grounded in legalistic notions such as 'obligation' or 'duty' in the context of general disbelief in the existence of a divine lawgiver as the source of such obligation. She recommended that philosophy of psychology should take the place of moral philosophy, until adequate accounts of such central notions as action and intention were available. Then, she suggested, philosophers might return to moral philosophy through an ethics of virtue.

What is virtue ethics? It is tempting to characterize it as a theory advocating acting virtuously, but this is insufficiently precise. Virtue ethics is usually seen as an alternative to utilitarianism or consequentialism in general (see CONSEQUENTIALISM; UTILITARIANISM). To put it roughly, utilitarianism says that we should maximize human welfare or utility. A utilitarian, however, may advocate acting virtuously for reasons of utility. Ethical theories are best understood in terms not of what acts they require, but of the reasons offered for acting in whatever way is in fact required.

Which properties of actions, then, according to virtue ethics, constitute our reason for doing them?

The properties of kindness, courage and so on. It is worth noting that there is a difference between acting virtuously and doing a virtuous action. One's doing a virtuous action may be seen as doing the action a virtuous person would do in those circumstances, though one may not oneself be a virtuous person. Virtue ethics, then, concerns itself not only with isolated actions but with the character of the agent. There are reasons for doing certain things (such as kind things), and also for being a certain type of person (a kind person).

This account of virtue ethics enables us to distinguish it from its other main opponent, deontology or Kantianism (see DEONTOLOGICAL ETHICS; KANT, I. §§9–10; KANTIAN ETHICS). A Kantian, for example, might claim that my reason for telling the truth is that to do so would be in accordance with the categorical imperative. That is a property of the action of telling the truth quite different from its being honest.

3 The good of the agent and the demandingness of morality

A pure form of virtue ethics will suggest that virtuous properties – 'thick' properties as opposed to thin properties such as 'rightness' and 'goodness' – of actions constitute our only reasons for performing them. Aristotle came close to this position, but it is perhaps more plausible to interpret him as claiming that the rationality of virtue lies in its promotion of the agent's *eudaimonia*. Aristotle's view is nevertheless radical. Since my *eudaimonia* consists only in the exercise of the virtues, I have no reason to live a non-virtuous life.

More common than pure forms of virtue ethics are pluralistic views according to which there are other reason-constituting properties, some perhaps of the kind advocated by utilitarians and Kantians. The open-mindedness of virtue ethics contrasts sharply at this point with what Bernard WILLIAMS has identified as the peculiar narrowness of focus in modern ethics. Considerations other than the moral are relevant to the question of how one should live. Modern virtue ethicists can thus adopt a position on the demandingness of morality between the extremes of Aristotle and their modern opponents. For they need claim neither that self-interest is constituted entirely by being moral nor that morality completely overrides self-interest.

Much of virtue theory has been concerned to develop Williams' criticism of utilitarianism and Kantianism that, through their impersonality and impartiality, the two violate the *integrity* of moral agents. Philippa Foot has developed these critical arguments in a direction favourable to virtue ethics. According to both the principle of utility and the Kantian categorical imperative, moral reasons, being universal, are independent of the desires of agents. Foot, impressed by the rationality of fulfilling one's own desires, has argued that moral reasons do depend on the desires of the agent, so that a person who acts consistently ungenerously may be described as ungenerous, but not necessarily as having any reason to act generously, unless they have a desire which would thereby be fulfilled. Foot is here expressing a doubt similar to Anscombe's about the possibility of ungrounded 'ought' judgments.

4 Agency and motivation

Imagine that you are thanking a friend for visiting you in hospital. She replies, 'Oh, it was nothing. It was obvious that morality required me to come.' This case, taken from an influential 1976 article by Michael Stocker, and related to the discussion in the previous section concerning the demandingness of morality and the pervasiveness of the moral point of view, serves to illustrate an ideal of agency which lies implicit in much modern ethical theory (see MORAL MOTIVATION; MORAL REALISM). The unattractiveness of this ideal can be avoided by utilitarians, who may argue that thinking in the way your friend did about morality is likely to be self-defeating in utilitarian terms. Even the utilitarians, however, can be charged with missing the point. What is wrong with your friend is not that moral thinking like hers fails to maximize utility. Nevertheless, the case constitutes a far more serious problem for Kantians, given Kant's insistence on the explicit testing of courses of action using the categorical imperative, and his view that the moral worth of an action lies entirely in its being done out of a sense of duty.

Modern virtue ethicists such as Lawrence Blum have endeavoured to replace this conception of moral agency with a virtue-centred ideal allowing agents to be moved directly by emotional concern for others. This ideal can once again be seen as emerging from Anscombe's attack on the notion of duty. A morality of duty is said to pay insufficient attention to the inner life: the dutiful agent is not doing, or feeling, enough (this criticism is an interesting counterpoint to the accusation that Kantianism is excessively demanding). The charge, then, is not only that modern moral theory fails to provide plausible justifying reasons for action, but that the motivational structure of what is clearly moral agency is quite different from what the theories lead us to expect. Moral agency consists at least partly in acting and feeling in ways prompted by bonds of partiality, requiring no further backing from impersonal ethical theory (see FRIENDSHIP).

5 Universality and tradition

We have already seen how some virtue theorists link moral reasons to motivation. This is one route to a narrowing of the scope of moral reasons. Without any motivation to do so, there is no reason, say, to maximize utility or respect the moral law. Another route is followed by writers such as Alasdair MacIntyre who ground moral rationality in traditions.

MacIntyre's critique of modern ethical theory, outlined in *After Virtue* (1981), is the most stringent in virtue theory. He claims that present moral discussion is literal nonsense: we unreflectively use a mix of concepts left over from moribund traditions; since these traditions are incommensurable, arguments using concepts from rival traditions are irresoluble and interminable. MacIntyre does not, however, follow through the implications of this critique into a Nietzschean moral scepticism, advocating instead a return to Aristotelian virtue ethics (see Nietzsche, F.). The question of how he accomplishes this is an example of a puzzle about virtue theory present since Anscombe's original article: after the sustained critique of modern ethical theory by virtue theorists, is the remaining conceptual apparatus sufficiently strong to support an alternative prescriptive ethics?

The relationship between modern virtue ethicists and Aristotle is complex. Most virtue ethicists, including Foot and MacIntyre, combine an Aristotelian emphasis on the virtues with a modern scepticism about the possibility of an objective theory of the good for an individual. Likewise, MacIntyre's stress on the importance of context is quite Aristotelian, but the relativism to which this leads him would be anathema to Aristotle (see Moral relativism). MacIntyre claims that goods are internal to practices, and not assessable from some external point of view, while Aristotle believed that teleological reflection on universal human nature enabled one to identify those practices which are good *haplōs*, 'simply good'.

The relativism of modern virtue ethics has emerged also in political theory in the debate between communitarians, such as MacIntyre, and liberals (see Community and communitarianism; Liberalism). Along with a predilection for virtue-centred over rule-centred ethics go preferences for the local and particular to the universal, the specific to the general, the embedded to the abstracted, the communal to the individual, the inexplicit to the explicit, the traditional to the revised, the partial to the impartial. In MacIntyre's work, the notion of goods internal to diachronic practices and grounded in traditions is tied to a criticism of a free-floating liberal self, choosing goods from some Archimedean standpoint. MacIntyre's narrative conception of a self opens another door for the readmittance of the notion of character into moral philosophy.

The most serious problem for relativism has yet to be resolved in modern virtue ethics. What are we to say of practices and ways of life constituting internally coherent traditions, yet containing undeniably evil components?

6 Practical reason

One reason for the fading of the notion of character in ethical theory is that utilitarianism and Kantianism have commonly been developed as ethics of rules to resolve dilemmas. An argument against a rule-based ethics is found in Aristotle's discussion of the legal virtue of *epieikeia*, 'equity'. Rules will always run out in hard cases, and some sensitivity is required on the part of the judge to fill the gap between the law and the world. Likewise, for Aristotle, the virtuous man possesses *phronēsis*, 'practical wisdom', a sensitivity to the morally salient features of particular situations which goes beyond an ability to apply explicit rules.

This view has been revived in virtue ethics, by among others Iris Murdoch and John McDowell, in his 1979 article, 'Virtue and Reason'. McDowell argues that we cannot postulate a world as seen by both the virtuous and the unvirtuous, and then explain the moral agency of the virtuous through their possessing some special desire. Since moral rules run out, any object of desire could not be made explicit. McDowell uses Wittgenstein to support his claim that rational action does not have to be rule-governed (see Wittgenstein, L.J.J. §§10–12). This has clear implications for moral education: it should consist in enabling the person to see sensitively, not (or at least not only) in inculcating rigid and absolute principles. This is one of the strands in the feminist critique of modern ethical theory, itself closely tied to virtue theory. Writers such as Carol Gilligan argue that the moral sensibility of women is less rule-governed than that of men, and this has influenced the 'ethics of care' of, for example, Nel Noddings.

The emphasis in virtue ethics on non-rational factors in moral motivation sits well with the notion of moral sensitivity. And this latter notion provides another standpoint from which one might criticize the basing of morality on the categorical imperative. As we have seen, Foot claims that immorality is not necessarily irrational, since moral reasons depend on the agent's desires. Writers such as McDowell who depict practical reason as perceptual can also deny that immorality is irrational. The unvirtuous lack not any capacity of the theoretical or calculative

intellect, but moral sensitivity. Unlike Foot, however, McDowell would argue that this is in fact a failure to perceive genuine reasons for action independent of the agent's motivations.

Again, in McDowell, we see the pastiche, characteristic of virtue ethics, of ancient and modern: rationality is made to depend on social practice, and yet, as Socrates thought, virtue turns out to be a kind of knowledge.

VIRTUES AND VICES

Introduction

The concept of a virtue can make an important contribution to a philosophical account of ethics, but virtue theory should not be seen as running parallel to other 'ethical theories' in trying to provide a guide to action.

Modern accounts of the virtues typically start from Aristotle, but they need to modify his view substantially, with respect to the grounding of the virtues in human nature; the question of what virtues there are; their unity; and their psychological identity as dispositions of the agent. In particular, one must acknowledge the historical variability of what have been counted as virtues.

Aristotle saw vices as failings, but modern opinion must recognize more radical forms of viciousness or evil. It may also need to accept that the good is more intimately connected with its enemies than traditional views have allowed. Virtue theory helps in the discussion of such questions by offering greater resources of psychological realism than other approaches.

1 Virtues and theory

Ethical theories are standardly presented as falling into three basic types, centring respectively on *consequences*, *rights* and *virtues* (see Consequentialism; Deontological ethics; Rights; Virtue ethics). One way of understanding this division into three is in terms of what each theory sees, at the most basic level, as bearing ethical value. For the first type of theory, it is *good states of affairs*; for the second, it is *right action*; while virtue theory puts most emphasis on the idea of a *good person*, someone who could be described also as an ethically admirable person. The last is an important emphasis, and the notion of a virtue is important in ethics; but its importance cannot be caught in this way, as the focus of a theory which is supposedly parallel to these other types of theory. Consequentialist and rights theories aim to systematize our principles or rules of action in ways that will, supposedly, help us to see what to do or to recommend in particular cases. A theory of the virtues cannot claim to do this: the theory itself says that what one needs in order to do and recommend the right things are virtues, not a theory about virtues. Moreover, the thoughts of a virtuous person do not consist entirely, or even mainly, of thoughts about virtues or about paradigms of virtuous people. Indeed, they will sometimes be thoughts about rights or good consequences, and this makes it clear that thoughts about the good person cannot displace these other ethical concepts, since a good person will have to use some such concepts. 'Virtue theory' cannot be on the same level as the other types of theory.

An emphasis on virtues is important to moral philosophy for other reasons. Although it need not exclude cognitivism, it shifts attention from morality as a system of propositions or truths to its psychological (and hence, eventually, social) embodiment in individual dispositions of action, thought and emotional reaction. It draws attention to the variety of reasons for action and judgment that may play a part in ethical life, beyond the theorists' favourites, duty and utility (see Moral motivation §§1–3; Morality and emotions). Such reasons will not typically embody virtue concepts themselves, or, still less, involve reflection on the

agent's own virtues. But virtue theory can help to explain how considerations such as 'she needs it', for instance, or 'he relied on what you said', can function as an agent's reasons. An approach through the virtues also leaves room for the important idea that ethically correct action may be only partly codifiable and may involve an essential appeal to judgment (see MORAL JUDGMENT §4; UNIVERSALISM IN ETHICS).

2 Beyond Aristotle: ground; content

The first systematic investigation of the virtues was made by Plato, in such works as *Gorgias* and the *Republic*, and it was extremely significant, for instance in setting the problem of the unity of the virtues (see §3). Plato also posed in a particularly challenging form questions about the value of virtues to their possessor. The classical account of the virtues, however, to which all modern treatments refer, is that of Aristotle (*Nicomachean Ethics*) (see ARISTOTLE §22–5). Just because of the power and the influence of this account, it is easy to underestimate the extent to which a modern theory needs to distance itself from Aristotle. A modern account is likely to agree with Aristotle that virtues are dispositions of character, acquired by ethical training, displayed not just in action but in patterns of emotional reaction. It will agree, too, that virtues are not rigid habits, but are flexible under the application of practical reason. But there are at least four matters on which it is likely to disagree with Aristotle, which may be labelled *ground*; *content*; *unity*; and *reality*.

Ground. Aristotle held that the virtues (for which the word in his language means only 'excellences' – see ARETĒ) had a teleological ground, in the sense that they represented the fullest development of a certain kind of natural creature, a nondefective male human being. No one now is going to agree with Aristotle that there are creatures who are biologically human beings but who are excluded from this full development by their nature as women or as 'natural slaves'. Having abandoned his views about women and slaves, modern thinkers face the harder question of how far they agree with Aristotle about the natural basis of the virtues. This in turn raises the question of how strongly one should feel about Aristotle's own teleological view. On one interpretation, he had a comprehensive functional conception of the contents of the universe, with each kind of creature fitting into a discoverable overall pattern. On such a conception, substantial parts of the theory of the virtues will be discoverable by top-down systematic inquiry which will tell us what sorts of creatures human beings are, and hence what their best life will be (see TELEOLOGICAL ETHICS). Other interpreters give a more moderate account of Aristotle's enterprise, according to which his intentions will be honoured by a hermeneutical inquiry into what we, now, regard as the most basic and valuable aspects of human beings.

Content. What is undeniably lacking from Aristotle's thought, as from that of other ancient thinkers, is an historical dimension. Some modern virtue theorists share this weakness. Aristotle's account is in several respects different from any account of the virtues one would give now, with respect both to what it puts in and what it leaves out. He gives a particularly important place to a quality called *megalopsuchia*, 'greatness of soul', which has a lot to do with a grand social manner and which bears even less relation to a contemporary ethic than its name, in itself, might suggest. A modern person, asked for the principal virtues, might well mention kindness and fairness. Fairness bears a relation to an important Aristotelian virtue, justice, but the latter is defined to an important extent in political and civic terms, and gives a fairly restricted account of fairness as a personal characteristic. Kindness is not an Aristotelian virtue at all. Moreover, there is no account of an important modern virtue, truthfulness; what Aristotle calls the virtue of truth is (surprisingly, as it seems to us) concerned exclusively with boasting and modesty.

There has been obvious historical variation in what is seen as the content of the virtues. Aquinas, who notably developed Aristotle's account, of course modified it to accommodate Christianity, holding in particular that besides the moral virtues, there were 'theological' virtues, which have God as their immediate object. The pagans were not in a position to display these, but so far as the moral virtues were concerned, they could be truly virtuous in the light of natural reason. However, there was still something imperfect about their virtue even at this level since, Aquinas held, the whole of ethical life is properly grounded in the virtue called charity, which has a divine origin.

For Hume, on the other hand, Aristotle's account and other pagan sources served to support an ethics of the virtues that was precisely designed to discredit and exclude Christianity (see HUME, D. §4). The historical variation, both in philosophical formulations and in cultural realizations of the virtues, raises wider issues of how theories of the virtues are to be understood. The conceptions of human nature and human circumstances that underlie such theories are open to wide reinterpretation in the face of changing values, and the Aristotelian presupposition that an understanding of human nature could yield a determinate account of the virtues – even if that idea is interpreted relatively unambitiously – looks unrealistic. There are of

course constants in the psychology and circumstances of human beings that make certain virtues, in some version or other, ubiquitous: in every society people need (something like) courage, (something like) self-control with regard to anger and sexual desire, and some version of prudence. These platitudes, which are stressed by those who look to a substantive universal virtue theory, severely underdetermine the content of such a theory. This is shown by the very simple consideration that the constant features of human life are indeed constant, but the virtues that have been recognized at different times and by different cultures vary considerably.

3 Beyond Aristotle (cont.): unity; reality

Unity. Aristotle inherited from Plato, and ultimately from Socrates, an interest in the unity of the virtues (see SOCRATES §5). Socrates seems to have held that there was basically only one virtue, which he called wisdom or knowledge. The conventional distinctions between the various virtues – justice, self-control, courage and the rest – were taken to mark only different fields of application of this power. Aristotle did think that there were separate virtues, but nevertheless his view came almost to the same thing as Socrates', since he thought that one could not have one virtue without having them all. One could not properly possess any one virtue unless one had the intellectual virtue which is called in Aristotle's language *phronēsis* (often translated as 'practical wisdom', but better rendered as 'judgment' or 'good sense'); but, Aristotle held, if one had this quality, then one had all the virtues.

It is not hard to see the general idea underlying this position. Generosity is linked to justice – someone who gives only what justice demands is not being generous. Similar points can be made about the interrelations of some other virtues. However, it is important to the theory of the virtues that they provide psychological explanations as well as normative descriptions, and from a realistic psychological point of view it is hard to deny (as many ancient Greeks other than Socrates and Aristotle agreed) that someone can have some virtues while lacking others. In particular, the so-called 'executive virtues' of courage and self-control can be present without other virtues; indeed, they themselves can surely be deployed in the interests of wicked projects. The refusal to acknowledge this may simply represent an ethical reluctance to give moral accolades to bad people.

The fact that the virtues can, to some degree, be separated from one another itself helps to give point to virtue theory. Some modern ethical theories do imply that there is basically only one moral disposition. Utilitarianism, at least in its direct form, places everything on impartial benevolence (see UTILITARIANISM; IMPARTIALITY); and though Kant himself did have a theory of the virtues, Kantianism insists on the primacy of a sense of duty (see KANT, I. §§9–11; KANTIAN ETHICS). An advantage of virtue theory is that it allows for a more complex and realistic account of ethical motivation.

Relatedly, it can acknowledge psychological connections between the ethical and other aspects of character, accepting that people's temperaments have something to do with how they conduct themselves ethically. For the same reason, virtue theory is implicitly opposed to sharp boundaries between the 'moral' and the 'nonmoral', and is likely to acknowledge that there is a spectrum of desirable characteristics, and that no firm or helpful line can be drawn around those that are specifically of moral significance. Aristotle did not even try to draw such a line: his own terminology distinguishes only between excellences of character and intellectual excellences, and one of the latter, *phronēsis*, is itself necessary to the excellences of character. Hume, who, unlike Aristotle, was surrounded by moralists who wanted to draw such a line, goes out of his way to mock the attempt to draw it, and his deliberately offensive treatment of the subject is still very instructive.

Reality. Aristotle conceived of the virtues as objective dispositional characteristics of people which they possess in at least as robust a sense as that in which a magnet possesses the power to attract metals, though people, unlike magnets, have of course acquired the dispositions – in the way appropriate to such things – by habituation. Modern scepticism, however, to some extent supported by social and cognitive psychology, questions whether we can take such a naïve view of what it is for someone to have a virtue. There are at least two different sources of doubt. One is the extent to which people's reactions depend on situation: it is claimed that they will act in ways that express a given virtue only within a rather narrow range of recognized contexts, and if the usual expectations are suspended or even, in some cases, slightly shifted, may not act in the approved style.

The other doubt concerns ascription. When we understand people's behaviour in terms of virtues and vices, or indeed other concepts of character, we are selecting in a highly interpretative way from their behaviour as we experience it, and the way in which we do this (as, indeed, we understand many other things) is in terms of stereotypes, scripts, or standard images, which may range from crude 'characters' to sophisticated and more individuated

outlines constructed with the help of types drawn, often, from fiction. The available range of such images forms part of the shifting history of the virtues. At different times there have been pattern books of virtue and vice, and one of the first was the *Characters* written by Theophrastus, a pupil of Aristotle.

Even assuming such ideas to be correct, it is not clear exactly to what extent they have a negative impact on virtue theory. Everyone knows that virtues do not express themselves under all circumstances, and also that agents may be very rigid in their ability to understand how a situation is to be seen in terms of virtues. Again, with regard to ascription, it is very important that if it is true that we construct our interpretations of another person's character in terms of a stock of images, it is equally true that the other person does so as well. The point is not so much that there is a gap between the interpreter and the person interpreted, but rather that all of us, as interpreters of ourselves and of others, use shared materials that have a history. There are lessons in such ideas for ethics generally and for virtue theory, but they need not be entirely sceptical. The points about the situational character of the virtues and about their ascription serve to remind us that an agent's virtues depend in many different ways on their relations to society: not simply in being acquired from society and reinforced or weakened by social forces, but also in the ways in which they are constructed from socially shared materials.

4 Vices, failings and evil

Aristotle named a variety of vices, each of which was basically constituted by the absence of the restraining or shaping influence of virtue, together with the operation of some natural self-centred motive. Thus cowardice was the disposition, in the absence of courage, to give in to fear; self-indulgence and irascibility the dispositions to give in to bodily pleasure and to anger. In this range of what may be called 'failings', actions that are expressions of vices do have distinctive motives, but those are not in themselves distinctively bad motives: it is rather that natural motives are expressed in ways in which they would not be expressed by a virtuous person. There are other failings in which the agent's motivation is distinctively deplorable, because it is constituted by the exaggeration, parody or perversion of a virtue: an ostentatious disposition to distribute gifts or favours, in place of generosity, or, to take a modern example, sentimentality in place of kindness. Aristotle notices some failings of this type, but, in line with his 'doctrine of the mean', he oversimplifies their psychology under an unexamined category of 'excess'.

A peculiar case, in Aristotle's treatment, is justice. At the level of actions, at least, it might be thought that there were no distinctive motives to injustice; a person can act unjustly from a variety of motives, and indeed Aristotle mentions the possibility that a coward might treat others unjustly, by 'getting an unfair share of safety'. If this is generalized, an unjust person might be understood not as one with some characteristic motive, but rather as one who is simply insensitive to considerations of justice. However, Aristotle does introduce a distinctive motive for injustice – 'greed', or the desire to have more than others. An unjust person, then – as opposed to someone who has some other vice as a result of which he acts unjustly – is, for Aristotle, a particular greedy type, one who might roughly be recognized in modern terms as 'a crook'.

Aristotle also notices another kind of failing or deficiency, a lack of perception or feeling for others, but this is typically registered by him only as an extreme characteristic, lying off the scale of the ethical, in the form of a brutality or beastliness which virtually falls out of the category of the human. The fact that he does not have anything to say about the more domesticated forms of such a failing, very familiar to us, is a corollary to his not recognizing a virtue of kindness.

It follows from Aristotle's holistic and teleological conception of virtue as the fulfilment of the highest human capacities that vices should basically be failings, instances of a lack or an absence. This hardly leaves room for a notion of the *vicious*: the nearest that Aristotle gets to such an idea is the figure of an obsessional and unscrupulous hedonist. We possess, only too obviously, notions of viciousness deeper and more threatening than this. They point to a concept conspicuously lacking from Aristotle (though to a lesser extent, perhaps, lacking from Plato) – the concept of evil.

This leads decisively beyond the conception of vices as failings, even very serious failings. Among evil or vicious motivations, a basic type is cruelty, the desire to cause suffering, a disposition which, as Nietzsche pointed out, contrasts markedly with brutality: it has to share, rather than lack, the sensitivity to others' suffering that is displayed by kindness. In the most typical modes of cruelty, agents derive their pleasure from the sense of themselves bringing about the pain or frustration of others, and their cruel behaviour is directly an attempted expression of power. Rather different from this, though close to it, is maliciousness, as it might be called; this comprises a motivation in the style of envy, where the desire is merely that other people's happiness should not exist. Persons in this

state of mind may be pleased if others come to grief, even though they do not bring it about themselves. Alberich, in Wagner's *Götterdämmerung*, says, 'Hagen, mein Sohn! hasse die Frohen!' – 'hate the happy'; such a hatred can have many expressions, only some of which involve the specifically active pleasures of cruelty.

Sometimes, cruelty may not only share, as it must, the perceptions that kindness uses, but model itself negatively on kindness, calculating what a kind person might want to do, in order to parody or subvert it. It then takes on the character of perversity. This style of reversal can be applied to virtues other than kindness. There is counter-justice, the disposition to frustrate the ends of justice, not simply in one's own interests, or to hurt or frustrate a particular person whom one hates or envies, but to take pleasure in the frustration of justice as such and the disappointments inflicted on those of good will. At the limit, this can constitute an almost selfless aesthetic of horribleness, one of the less obvious forms that may be taken by the satisfactions of Milton's Satan, with his resolve that evil should be his good.

5 Links between virtue and vice

Unlike the failings recognized by Aristotle, these evil motivations are more than mere negations. It is important, however, that this need not be taken as a metaphysical claim: one need not be committed to a Manichean view (or even the very various compromises with such a view that have been negotiated by orthodox Christianity), to the effect that human nature or the world itself contains some perversely destructive principle. One might, for instance, hold, as some optimistic programmes of psychotherapy do, that vicious and cruel motivations are, indeed, perversions, produced by a failure of love or other deficiency in the individual's upbringing. This is an encouraging position, inasmuch as it holds out the hope of a world free of such motivations, but it does not think that such motivations, while they exist, are to be understood simply in terms of the lack of a shaping or restraining influence. It would accept that vicious motivations were specially and inventively active.

Other psychological and social views are less hopeful. It is not simply that they see no ground for utopian hopes that the world could ever be freed from vicious motivations. Some of them detect deeper ways in which virtue, and more generally the good, depend on their opposites. At the most superficial level, there are contemporary versions of the point made in Mandeville's *Fable of the Bees* (1714) (see MANDEVILLE, B.): many benefits, including ethical benefits, have come from the development of commercial society, but there is no known way of replacing greed as a means of sustaining such a society. At another level, there is no doubt that valuable human achievements, for instance in the arts and sciences, have come about only because of a certain indifference to values of justice and benevolence, both at an institutional level and in the lives of those who have brought about these achievements. (Here, as so often, moralists have to face the question whether or not they are relieved that the values which they think should prevail have not always done so.)

At the deepest level, however, it is not a question simply whether nonethical values may often require the neglect or denial of morality, but whether morality itself does not require it. One of the metaphysicians' illusions, Nietzsche said in 1886, is 'the belief in opposing values'. In fact, he believed that moral values always turn out to implicate their opposites – historically (in terms of how new moral values come to exist), socially (in terms of how they sustain themselves), and psychologically (in terms of how they are learned and how they derive their energy).

Even if we accept the force of the Nietzschean suspicions, this need not damage, but rather encourages, the project of thinking about morality in ways that give an important place to virtues and vices. A theory of virtues, handled in a truthful way, offers better hope of being psychologically realistic than other prominent pictures of the ethical life do. If, further, it extends its realism to the motivations of immorality as well, and does not treat them as mere negations of the moral dispositions, it will better understand morality itself. It will be more successful in this than other theories of morality, which usually pass over in silence the forces that oppose it, or register them simply as objects of moral disapproval, or treat them as the products of a (typically unexplained) cognitive failure.

VISION

Vision is the most studied sense. It is our richest source of information about the external world, providing us with knowledge of the shape, size, distance, colour and luminosity of objects around us. Vision is fast, automatic and achieved without conscious effort; however, the apparent ease with which we see is deceptive. Since Kepler characterized the formation of the retinal image in the early seventeenth century, vision theorists have known that objects do not look the way they appear on the retina. The retinal image is two-dimensional, yet we see three dimensions; the size and shape of the image that an object casts on the retina varies with the distance and perspective of the observer, yet we experience objects as having constant size and shape. The primary task of a theory of vision is to explain how useful information about the external world is recovered from the changing retinal image.

Theories of vision fall roughly into two classes. *Indirect* theories characterize the processes underlying visual perception in psychological terms, as, for example, inference from prior data or construction of complex percepts from basic sensory components. *Direct* theories tend to stress the richness of the information available in the retinal image, but, more importantly, they deny that visual processes can be given any correct psychological or mental characterization. Direct theorists, while not denying that the processing underlying vision may be very complex, claim that the complexity is to be explicated merely by reference to non-psychological, neural processes implemented in the brain.

The most influential recent work in vision treats it as an information-processing task, hence as indirect. Computational models characterize visual processing as the production and decoding of a series of increasingly useful internal representations of the distal scene. These operations are described in computational accounts by precise algorithms. Computer implementations of possible strategies employed by the visual system contribute to our understanding of the problems inherent in complex visual tasks such as edge detection or shape recognition, and make possible the rigorous testing of proposed solutions.

VITALISM

Vitalists hold that living organisms are fundamentally different from non-living entities because they contain some non-physical element or are governed by different principles than are inanimate things. In its simplest form, vitalism holds that living entities contain some fluid, or a distinctive 'spirit'. In more sophisticated forms, the vital spirit becomes a substance infusing bodies and giving life to them; or vitalism becomes the view that there is a distinctive organization among living things. Vitalist positions can be traced back to antiquity. Aristotle's explanations of biological phenomena are sometimes thought of as vitalistic, though this is problematic. In the third century BC, the Greek anatomist Galen held that vital spirits are necessary for life. Vitalism is best understood, however, in the context of the emergence of modern science during the sixteenth and seventeenth centuries. Mechanistic explanations of natural phenomena were extended to biological systems by Descartes and his successors. Descartes maintained that animals, and the human body, are 'automata', mechanical devices differing from artificial devices only in their degree of complexity. Vitalism developed as a contrast to this mechanistic view. Over the next three centuries, numerous figures opposed the extension of Cartesian mechanism to biology, arguing that matter could not explain movement, perception, development or life. Vitalism has fallen out of favour, though it had advocates even into the twentieth century. The most notable is Hans Driesch (1867–1941), an eminent embryologist, who explained the life of an organism in terms of the presence of an *entelechy*, a substantial entity controlling organic processes. Likewise, the French philosopher Henri Bergson (1874–1948) posited an *élan vital* to overcome the resistance of inert matter in the formation of living bodies.

VITORIA, FRANCISCO DE (*c*.1486–1546)

Francisco de Vitoria, who spent most of his working life as Prime Professor of Theology at Salamanca, Spain, was one of the most influential political theorists in sixteenth-century Catholic Europe. By profession he was a theologian, but like all theologians of the period he regarded theology as the 'mother of sciences', whose domain covered everything governed by divine or natural, rather than human, law; everything, that is, which belonged to what we would describe as jurisprudence. Vitoria's writings covered a wide variety of topics, from the possibility of magic to the acceptability of suicide. But it is on those which deal with the most contentious juridical issues of the period – the nature of civil power and of kingship,

the power of the papacy and, above all, the legitimacy of the Spanish conquest of America – that his fame chiefly rests.

ANTHONY PAGDEN

VOLTAIRE (FRANÇOIS-MARIE AROUET) (1694–1778)

Voltaire remains the most celebrated representative of the reformers and free-thinkers whose writings define the movement of ideas in eighteenth-century France known as the Enlightenment. He was not, however, a systematic philosopher with an original, coherently argued worldview, but a *philosophe* who translated, interpreted and vulgarized the work of other philosophers. His own writings on philosophical matters were deeply influenced by English empiricism and deism. His thought is marked by a pragmatic rationalism that led him, even in his early years, to view the world of speculative theorizing with a scepticism that was often expressed most effectively in his short stories. As a young man, Voltaire was particularly interested in Locke and Newton, and it was largely through his publications in the 1730s and 1740s that knowledge of Lockean epistemology and Newtonian cosmology entered France and eventually ensured the eclipse of Cartesianism.

After his stay in England Voltaire became interested in philosophical optimism, and his thinking reflected closely Newton's view of a divinely ordered human condition, to which Alexander Pope gave powerful poetic expression in his *Essay on Man* (1733–4). This was reinforced for the young Voltaire by Leibnizian optimism, which offered the view that the material world, being necessarily the perfect creation of an omnipotent and beneficent God, was the 'best of all possible worlds', that is to say the form of creation chosen by God as being that in which the optimum amount of good could be enjoyed at the cost of the least amount of evil.

Voltaire's later dissatisfaction with optimistic theory brought with it a similar loss of faith in the notion of a meaningful order of nature, and his earlier acceptance of the reality of human freedom of decision-taking and action was replaced after 1748 with a growing conviction that such freedom was illusory. The 1750s witness Voltaire's final abandonment of optimism and providentialism in favour of a more deterministically orientated position in which a much bleaker view of human life and destiny predominates. Pessimistic fatalism was a temporary phase in his thinking, however, and was replaced in turn by a melioristic view in which he asserted the possibilities of limited human action in the face of a hostile and godless condition.

VOLUNTARISM

Voluntarism is a theory of action. It traces our actions less to our intellects and natural inclinations than to simple will or free choice. Applied to thinking about God's actions, voluntarism led late medieval philosophers to see the world's causal and moral orders as finally rooted in God's sheer free choice, and to take God's commands as the source of moral obligation. Medieval voluntarism helped pave the way for empiricism, Cartesian doubt about the senses, legal positivism and Reformation theology.

VON WRIGHT, GEORG HENRIK (1916–2003)

G.H. von Wright was one of the most influential analytic philosophers of the twentieth century. Born in Helsinki, Finland, von Wright did his early work on logic, probability and induction under the influence of logical empiricism. In 1948–51 he served as Ludwig Wittgenstein's successor at Cambridge, but returned to his homeland and later became a member of the Academy of Finland. He did pioneering work on the new applications of logic: modal logic, deontic logic, the logic of norms and action, preference logic, tense logic, causality and determinism. In the 1970s his ideas about the explanation and understanding of human action helped to establish new links between the analytic tradition and Continental hermeneutics. Von Wright's later works, which are eloquent books and essays written originally in his two native languages (Swedish and Finnish), deal with issues of humanism and human welfare, history and the future, technology and ecology.

WANG YANGMING (1472–1529)

Wang Yangming was an influential Confucian thinker in sixteenth-century China who, like other Confucian thinkers, emphasized social and political responsibilities and regarded cultivation of the self as the basis for fulfilling such responsibilities. While sometimes drawing on ideas and metaphors from Daoism and Chan Buddhism, he criticized these schools for their neglect of family ties and social relations. And, in opposition to a version of Confucianism which emphasized learning, he advocated directly attending to the mind in the process of self-cultivation.

WAR AND PEACE, PHILOSOPHY OF

The war/peace dichotomy is a recurrent one in human thought and the range of experience it interprets is vast. Images of war and peace permeate religion, literature and art. Wars, battles, pacts and covenants appear as outcomes and antecedents in historical narratives. Recurrent patterns of warlike and pacific behaviour invite scientific explanations in terms of underlying biological, psychological or economic processes. War and peace are also often matters of practical concern, predicaments or opportunities that call for individual or collective action. While philosophers have explored all these ways of looking at war and peace, they have paid most attention to the practical aspects of the subject, making it part of moral and political philosophy.

Practical concern with war and peace can go in either of two main directions, one focusing on war and the other on peace. Those who doubt that war can be abolished naturally worry about how it can be regulated. So long as war is possible, there will be principles for waging it. Whether such principles should limit war-making to ends like self-defence or leave the choice to the discretion of political and military leaders is a matter of continuing dispute. Nor is there agreement regarding restrictions on the conduct of war, some holding that belligerents need only avoid disproportionate damage, others that it is morally wrong to harm innocents (for example, noncombatants). In situations of emergency both limits may give way, and moralists have debated whether this relaxation of standards is defensible. Disputes over the principles governing war raise difficult questions about action, intention and the character of morality itself.

If we think that wars can be prevented, it becomes important to focus on the conditions of permanent peace. Some who do this conclude that peace depends on the conversion of individuals to an ethic of nonviolence, others that it requires strengthening the rule of law. According to a powerful version of the latter argument, the absence of law creates a condition in which persons and communities are at liberty to invade one another: a condition that, in Hobbes's classic metaphor, is a 'state of nature' which is also a perpetual state of war. While treaties of peace may terminate particular wars, only political institutions that establish the rule of law within and between communities can provide security and guarantee peace.

WEBER, MAX (1864–1920)

Max Weber, German economist, historian, sociologist, methodologist and political thinker, is of philosophical significance for his attempted reconciliation of historical relativism with the possibility of a causal social science; his notion of a *verstehende* (understanding) sociology; his formulation, use and

epistemic account of the concept of 'ideal types'; his views on the rational irreconcilability of ultimate value choices, and particularly his formulation of the implications for ethical political action of the conflict between ethics of conviction and ethics of responsibility; and his sociological account of the causes and uniqueness of the Western rationalization of life.

These topics are closely related: Weber argued that the explanatory interests of the historian and social scientist vary historically and that the objects of their interest were constituted in terms of cultural points of view, and that consequently their categories are ultimately rooted in evaluations, and hence are subjective. But he also argued that social science cannot dispense with causality, and that once the categories were chosen, judgments of causality were objective. The explanatory interests of the sociologist, as he defined sociology, were in understanding intentional action causally, but in terms of categories that were culturally significant, such as 'rational action'. Much of his influence flowed from his formulation of the cultural situation of the day, especially the idea that the fate of the time was to recognize that evaluations were inescapably subjective and that the world had no inherent 'meaning'. The existential implications of this novel situation for politics and learning were strikingly formulated by him: science could not tell us how to live; politics was as a choice between warring gods. Weber's scholarly work and his politics served as a model for Karl Jaspers, and a subject of criticism and analysis for other philosophers, such as Karl Löwith, Max Scheler, and the Frankfurt School.

REGIS A. FACTOR

WEIL, SIMONE (1909–43)

Simone Weil's life and work represent an unusual mixture of political activism, religious mysticism and intense speculative work on a wide range of topics, including epistemology, ethics and social theory. Much of her most important writing survives in fragmentary form, in notebooks published after her untimely death. Though Jewish by family, her attitude to Judaism was largely hostile; and despite a deep commitment in the later part of her life to Christian ideas and symbols, she consistently refused to be baptized. Her religious views are eclectic in many ways, drawing on Plato and on Hindu sources. In everything she wrote, she was preoccupied with the dehumanizing effects of economic unfreedom and the servile labour required by industrial capitalism, but this is only one instance, for her, of the experience of 'necessity' or 'gravity' that dominates material transactions. The essence of moral and spiritual action is the complete renunciation of any privileged position for an ego outside the world of 'necessity'. Such renunciation is the only escape from necessity, in fact: what she calls 'decreation' becomes our supremely creative act, since only in the ego's absence is love, or an apprehension of non-self-oriented goods, possible. Marx, Kant and the gospels are all in evidence here.

ROWAN WILLIAMS

WELFARE

Notions of welfare occur widely in political philosophy and political argument. For example, utilitarianism is a social ethic that may be interpreted as giving a pre-eminent place to the idea that the welfare of society should be the overriding goal of public policy. Discussion of the ethics of redistribution focuses upon the institutions and practices of the so-called welfare state. Even those not convinced that we can validly speak of animal rights will often accept that considerations of animal welfare should play a part in legislation and morals. Moreover, the concept of welfare is clearly related to, and indeed overlaps with, concepts like 'needs' or 'interests', which are also central to public decision-making and action.

Welfare can be thought of in three ways. First, there is a subjective sense, in which to say that something contributes to a person's welfare is to say that it makes for the satisfaction of a preference. However, people can adapt their preferences to their circumstances, and happy slaves might be better off changing their preferences than having them satisfied. This thought leads on to the second sense of welfare as doing well according to some objective measure, like the possession of property. However, this conception can ignore subjective differences between people and fail to account for their capacity to take advantage of their objective circumstances. Hence, a third conception of welfare would make the capacity to take advantage of one's possessions an essential element of welfare. A satisfactory overall conception will have to bring these ideas together.

WHEWELL, WILLIAM (1794–1886)

William Whewell's two seminal works, *History of the Inductive Science, from the Earliest to the Present Time* (1837) and *The Philosophy of the Inductive Sciences, Founded upon their History* (1840), began a new era in the philosophy of science. Equally critical of the British 'sensationalist' school, which founded all knowledge on experience, and the German idealists, who based science on a priori ideas, Whewell undertook to survey the history of all known sciences in search of a better explanation of scientific discovery. His conclusions were as bold as his undertaking. All real knowledge, he argued, is 'antithetical', requiring mutually irreducible, ever-present, and yet inseparable empirical and conceptual components. Scientific progress is achieved not by induction, or reading-out theories from previously collected data, but by the imaginative 'superinduction' of novel hypotheses upon known but seemingly unrelated facts. He thus broke radically with traditional inductivism – and for nearly a century was all but ignored. In *Philosophy* the antithetical structure of scientific theories and the hypothetico-deductive account of scientific discovery form the basis for novel analyses of scientific and mathematical truth and scientific methodology, critiques of rival philosophies of science, and an account of the emergence and refinement of scientific ideas.

WHITEHEAD, ALFRED NORTH (1861–1947)

Whitehead made fundamental contributions to modern logic and created one of the most controversial metaphysical systems of the twentieth century. He drew out what he took to be the revolutionary consequences for philosophy of the new discoveries in mathematics, logic and physics, developing these consequences first in logic and then in the philosophy of science and speculative metaphysics. His work constantly returns to the question: What is the place of the constructions of mathematics, science and philosophy in the nature of things?

Whitehead collaborated with Bertrand Russell on *Principia Mathematica* (1910–13), which argues that all pure mathematics is derivable from a small number of logical principles. He went on in his philosophy of science to describe nature in terms of overlapping series of events and to argue that scientific explanations are constructed on that basis. He finally expanded and redefined his work by developing a new kind of speculative metaphysics. Stated chiefly in *Process and Reality* (1929), his metaphysics is both an extended reflection on the character of philosophical inquiry and an account of the nature of all things as a self-constructing 'process'. On this view, reality is incomplete, a matter of the becoming of 'occasions' which are centres of activity in a multiplicity of serial processes whereby the antecedent occasions are taken up in the activities of successor occasions.

WILL, FREEDOM OF THE

See Free will

WILL, THE

As traditionally conceived, the will is the faculty of choice or decision, by which we determine which actions we shall perform. As a faculty of decision, the will is naturally seen as the point at which we exercise our freedom of action – our control of how we act. It is within our control or up to us which actions we perform only because we have a capacity to decide which actions we shall perform, and it is up to us which such decisions we take. We exercise our freedom of action through freely taken decisions about how we shall act.

From late antiquity onwards, many philosophers took this traditional conception of the will very seriously, and developed it as part of a general theory of specifically human action. Human action, on this theory, is importantly different from animal action. Not only do humans have a freedom of or control over their action which animals lack; but this freedom supposedly arises because humans can act on the basis of reason, while animal action is driven by appetite and instinct. Both this freedom and rationality involve humans possessing what animals are supposed to lack: a will or rational appetite – a genuine decision-making capacity.

From the sixteenth century on, this conception of the will and its role in human action met with increasing scepticism. There was no longer a consensus that human action involved mental capacities radically unlike those found in animals. And the idea that free actions are explained by free decisions

of the will came to be seen as viciously regressive: if our freedom of action has to come from a prior freedom of will, why shouldn't that freedom of will have to come from some yet further, will-generating form of freedom – and so on ad infinitum?

Yet it is very natural to believe that we do have a decision-making capacity, and that it is up to us how we exercise that capacity – that it is indeed up to us which actions we decide to perform. The will-scepticism of early modern Europe, which persists in much modern Anglophone philosophy of action, may then have involved abandoning a model of human action and human rationality that is deeply part of common sense. We need to understand this model far better before we can conclude that its abandonment by so many philosophers really was warranted.

THOMAS PINK

WILLIAM OF OCKHAM (*c.*1287–1347)

William of Ockham is a major figure in late medieval thought. Many of his ideas were actively – sometimes passionately – discussed in universities all across Europe from the 1320s up to the sixteenth century and even later. Against the background of the extraordinarily creative English intellectual milieu of the early fourteenth century, in which new varieties of logical, mathematical and physical speculation were being explored, Ockham stands out as the main initiator of late scholastic nominalism, a current of thought further exemplified – with important variants – by a host of authors after him, from Adam Wodeham, John Buridan and Albert of Saxony to the school of John Mair far into the sixteenth century.

As a Franciscan friar, Ockham taught theology and Aristotelian logic and physics from approximately 1317 to 1324, probably in Oxford and London. He managed to develop in this short period an original and impressive theological and philosophical system. However, his academic career was interrupted by a summons to the Papal Court at Avignon for theological scrutiny of his teachings. Once there, he became involved in the raging quarrel between Pope John XXII and the Minister General of the Franciscan Order, Michael of Cesena, over the poverty of the church. Ockham was eventually excommunicated in 1328. Having fled to Munich, where he put himself under the protection of the Emperor Ludwig of Bavaria, he fiercely continued the antipapal struggle, devoting the rest of his life to the writing of polemical and politically-oriented treatises.

Because he never was officially awarded the title of Doctor in Theology, Ockham has been traditionally known as the *venerabilis inceptor*, the 'venerable beginner', a nickname which at the same time draws attention to the seminal character of his thought. As a tribute to the rigour and strength of his arguments, he has also been called the 'Invincible Doctor'.

The core of his thought lies in his qualified approach to the old problem of universals, inherited by the Christian world from the Greeks through Porphyry and Boethius. Ockham's stand is that only individuals exist, generality being but a matter of signification. This is what we call his nominalism. In the mature version of his theory, species and genera are identified with certain mental qualities called concepts or intentions of the mind. Ontologically, these are individuals too, like everything else: each individual mind has its own individual concepts. Their peculiarity, for Ockham, lies in their representative function: a general concept *naturally signifies* many different individuals. The concept 'horse', for instance, naturally signifies all singular horses and the concept 'white' all singular white things. They are not arbitrary or illusory for all that: specific and generic concepts, Ockham thought, are the results of purely natural processes safely grounded in the intuitive acquaintance of individual minds with real singular objects; and these concepts do cut the world at its joints. The upshot of Ockham's doctrine of universals is that it purports to validate science as objective knowledge of necessary connections, without postulating mysterious universal entities 'out there'.

Thought, in this approach, is treated as a mental language. Not only is it composed of signs, but these mental signs, natural as they are, are also said to combine with each other into propositions, true or false, just as extra-mental linguistic signs do; and in so doing, to follow rules of construction very similar to those of spoken languages. Ockham thus endowed mental discourse with grammatical categories. However, his main innovation in this respect is that he also adapted and transposed to the fine-grained analysis of mental language a relatively new theoretical apparatus that had been emerging in Europe since the twelfth century: the theory of the 'properties of terms' – the most important part of the *logica modernorum*, the 'logic of the moderns' – which was originally intended for the semantical analysis of spoken languages. Ockham in effect (along with some of his contemporaries, such as Walter Burley) promoted this new brand of semantical analysis to the rank of philosophical method *par excellence*. In a wide variety of philosophical and theological discussions, he made sustained use of the technical notions of 'signification',

'connotation' and, above all, 'supposition' (or reference) and all their cognates. His distinctive contribution to physics, for example, consists mainly in semantical analyses of problematic terms such as 'void', 'space' or 'time', in order to show how, in the end, they refer to nothing but singular substances and qualities.

Ockham's rejection of universals also had a theological aspect: universals, if they existed, would unduly limit God's omnipotence. On the other hand, he was convinced that pure philosophical reasoning suffices anyway for decisively refuting realism regarding universals, since all its variants turn out to be ultimately self-contradictory, as he endeavoured to show by detailed criticism.

On the whole, Ockham traced a sharper dividing line than most Christian scholastics before him between theological speculation based on revealed premises and natural sciences in the Aristotelian sense, that is those based on empirical evidence and self-evident principles. He wanted to maintain this clear-cut distinction in principle through all theoretical and practical knowledge, including ethics and political reasoning. In this last field, in particular, to which Ockham devoted thousands of pages in the last decades of his life, he strenuously defended the independence of secular power from ecclesiastical power, stressing whenever he could the autonomy of right reason in human affairs.

CLAUDE PANACCIO

WILLIAMS, BERNARD ARTHUR OWEN (1929–2003)

Bernard Williams wrote on the philosophy of mind, especially personal identity, and political philosophy; but the larger and later part of his published work is on ethics. He is hostile to utilitarianism, and also attacks a view of morality associated in particular with Kant: people may only be properly blamed for what they do voluntarily, and what we should do is the same for all of us, and discoverable by reason. By contrast Williams holds that luck has an important role in our evaluation of ourselves and others; in the proper attribution of responsibility the voluntary is less central than the Kantian picture implies. Williams thinks shame a more important moral emotion than blame. Instead of there being an independent set of consistent moral truths, discoverable by reason, how we should live depends on the emotions and desires that we happen to have. These vary between people, and are typically plural and conflicting. Hence for Williams ethical judgment could not describe independent or real values – by contrast with the way in which he thinks that scientific judgment may describe a real independent world.

WINDELBAND, WILHELM

See Neo-Kantianism

WITTGENSTEIN, LUDWIG JOSEF JOHANN (1889–1951)

Introduction

Ludwig Wittgenstein was born in Vienna on 26 April 1889 and died in Cambridge on 29 April 1951. He spent his childhood and youth in Austria and Germany, studied with Russell in Cambridge from 1911 to 1914 and worked again in Cambridge (with some interruptions) from 1929 to 1947.

His first book, the *Tractatus Logico-Philosophicus*, was published in German in 1921 and in English translation in 1922. It presents a logical atomist picture of reality and language. The world consists of a vast number of independent facts, each of which is in turn composed of some combination of simple objects. Each object has a distinctive logical shape which fits it to combine only with certain other objects. These objects are named by the basic elements of language. Each name has the same logical shape, and so the same pattern of possibilities of combination, as the object it names. An elementary sentence is a combination of names and if it is true it will be a picture of the isomorphic fact formed by the combination of the named objects. Ordinary sentences, however, are misleading in their surface form and need to be analysed before we can see the real complexity implicit in them.

Other important ideas in the *Tractatus* are that these deep truths about the nature of reality and representation cannot properly be *said* but can only be *shown*. Indeed Wittgenstein claimed that pointing to this distinction was central to his book. And he embraced the paradoxical conclusion that most of the *Tractatus* itself is, strictly, nonsense. He also held that other important things can also be shown but not said, for example, about there being a certain truth in solipsism and about the nature of value. The book is brief and written in a simple and elegant way. It has inspired writers and musicians as well as being a significant influence on logical positivism.

After the *Tractatus* Wittgenstein abandoned philosophy until 1929, and when he returned to it

he came to think that parts of his earlier thought had been radically mistaken. His later ideas are worked out most fully in the *Philosophical Investigations*, published in 1953.

One central change is from presenting language as a fixed and timeless framework to presenting it as an aspect of vulnerable and changeable human life. Wittgenstein came to think that the idea that words name simple objects was incoherent, and instead introduced the idea of 'language games'. We teach language to children by training them in practices in which words and actions are interwoven. To understand a word is to know how to use it in the course of the projects of everyday life. We find our ways of classifying things and interacting with them so natural that it may seem to us that they are necessary and that in adopting them we are recognizing the one and only possible conceptual scheme. But if we reflect we discover that we can at least begin to describe alternatives which might be appropriate if certain very general facts about the world were different or if we had different interests.

A further aspect of the change in Wittgenstein's views is the abandonment of sympathy with solipsism. On the later view there are many selves, aware of and co-operating with each other in their shared world. Wittgenstein explores extensively the nature of our psychological concepts in order to undermine that picture of 'inner' and 'outer' which makes it so difficult for us to get a satisfactory solution to the so-called 'mind–body problem'.

Although there are striking contrasts between the earlier and later views, and Wittgenstein is rightly famous for having developed two markedly different philosophical outlooks, there are also continuities. One of them is Wittgenstein's belief that traditional philosophical puzzles often arise from deeply gripping but misleading pictures of the workings of language. Another is his conviction that philosophical insight is not to be gained by constructing quasi-scientific theories of puzzling phenomena. Rather it is to be achieved, if at all, by seeking to be intellectually honest and so to neutralize the sources of confusion.

1 Life

Wittgenstein was the eighth and last child of a wealthy Austrian industrialist. From 1903–8 he was educated on the assumption that he would be an engineer and in 1908 he came to Manchester to study aeronautics. He continued with this for three years, but at the same time developed his interest in philosophy. He was particularly engaged with logic and the foundations of mathematics, in connection with which he read FREGE (§§6–10) and RUSSELL. In October 1911 he gave up engineering and, on Frege's advice, came to Cambridge to study with Russell. In the 1914–18 war he served in the Austro-Hungarian army and during this time completed the *Tractatus Logico-Philosophicus* (1922).

For a time Wittgenstein thought that the *Tractatus* said everything which could be said in philosophy, and so he turned to other things. From 1920 to 1926 he was a schoolteacher in Austria, though this was not a success, since he was severe and demanded too much of his pupils. In 1926–8 he helped to design a house for his sister. In 1927 he resumed philosophical discussion with some members of the Vienna Circle, and in 1929 he returned to Cambridge, lecturing there from 1930 to 1936. From 1936 to 1938 he visited Norway and Ireland, returning to Cambridge in 1938 and being appointed professor there in 1939. He held the chair until 1947, although from 1941 to 1944 he was given leave of absence to work first at Guy's Hospital, London, then at the Royal Victoria Infirmary, Newcastle. After resigning his chair in 1947 he lived in various places, Ireland chief among them, and also visited America.

Wittgenstein impressed those who met him with the power both of his intellect and personality. He had an intense concern for truth and integrity which exerted great attraction, but which also made him difficult to deal with since he was liable to accuse others of superficiality or dishonesty. He greatly disliked what he perceived as the artificiality and pretentiousness of academic life. His later ideas became known in the 1930s and 1940s through the circulation of copies of *The Blue and Brown Books* (1958) and reports of his lectures. They acquired considerable influence with some who found them inspiring, but others thought them irritatingly obscure.

2 Works and method of writing

Throughout his life Wittgenstein wrote down his thoughts in notebooks, returning to the same topics many times, trying to get the most direct and compelling formulation of the ideas. He then made selections and arrangements from these remarks, followed by yet further selection, reworking and rearrangement. The *Tractatus* was the only book published during his lifetime. In 1930 he assembled what we now know as the *Philosophical Remarks*, a work still having much of the outlook of the *Tractatus* and also showing considerable sympathies with verificationism, and in 1932–4 he wrote the *Philosophical Grammar*, in which some central themes of the later philosophy are foreshadowed. But he was not satisfied with either of these, and from 1936 onwards worked on various versions of what we now know as the *Philosophical Investigations* (1953), which he hoped would provide a definitive presentation of his thought. The earlier half of the volume is the part of his work with which he was most nearly satisfied, but he was never fully content with any of it, and in 1949 he abandoned the project of completing it.

The other books we have under his name are all early or intermediate versions of material, left in his papers and edited and published after his death. The *Notebooks* are preliminary versions of ideas which later became the *Tractatus*. *The Blue and Brown Books* were prepared so as to help his students in 1932 and 1933. *Remarks on the Foundations of Mathematics* (1956) contains ideas he worked on from 1937 to 1944 and which he intended at that time to form the second part of the *Investigations* (rather than the psychological topics we now have). From 1944 onwards he worked mainly on philosophical psychology: *Zettel* (1967), *Remarks on the Philosophy of Psychology I and II* (1980) and *Last Writings on Philosophical Psychology I and II* (1982) are from these years. From 1950 to 1951 we also have *On Certainty* (1969) and *Remarks on Colour* (1977). Another source for his views is his conversations and lectures as recorded by friends and pupils.

3 The picture theory of meaning

The *Tractatus* consists of nearly eighty printed pages of numbered remarks. The numbers do not run consecutively but are designed to indicate the relative importance and role of the remarks. There are seven major sentences and each of them (except 7) has subordinate and clarificatory remarks following it, labelled '2.2', '5.4' and so on, down as far as such numbers as '4.0312'.

The topics that preoccupied Wittgenstein when he arrived in Cambridge included the nature of logical truth and Russell's Theory of Types (see THEORY OF TYPES). On both of these matters Russell held that we need an account of very general features of the world and of the kinds of things in it. But Wittgenstein soon came to think that the route to insight was through the contemplation of the nature and presuppositions of individual meaningful sentences such as 'Socrates is wise' and that this contemplation showed Russell's approach to be misguided.

The central fact about such individual sentences is that each says one thing – that Socrates is wise, for example – but is essentially such that it may be either true or false. A false sentence is both out of touch with the world, inasmuch as it is false, but also in touch with the world, inasmuch as it succeeds in specifying a way that things might be. Wittgenstein holds that all this is possible only because the sentence is complex and has components which represent elements of reality, which exist whether the sentence is true or false and are (potentially) constituents of states of affairs. So, in rough illustration, 'Socrates' represents Socrates and 'is wise' represents wisdom. The truth or falsity of the sentence then depends on whether these elements are or are not assembled into a fact.

Not all sequences of sentence components are acceptable. A mere list of names (for example, 'Socrates Plato') does not hang together as a sentence. And although it looks as if we may apply a predicate to itself (as in 'is in English is in English' or 'is wise is wise'), it seems important to disallow such sequences as truth-evaluable sentences, on pain of falling into Russell's paradox. Russell's account of these matters is that elements of reality come divided into different types – individuals, properties and so on – and that a sentence is to be allowed as meaningful, and so truth-evaluable, only if the elements picked out by the components are of suitably related types.

Wittgenstein maintains, against this, that we do not need rules to bar sentences which would lead to paradox, because when we properly understand the nature of our language we see that we cannot formulate the supposed sentences in the first place. We think we can only because we have misidentified that component in 'Socrates is wise' the presence of which in the sentence attributes wisdom to Socrates. This component is not the phrase 'is wise' but the property which the word 'Socrates' has when the words 'is wise' are written to the right of it. To see why this is plausible, consider the fact that there could be a language in which properties are attributed to people by writing their names in different colours. For example, we could claim that Socrates is wise by writing 'Socrates' in red letters. In such a language we could never formulate any

analogue to 'is wise is wise' because we could not take the redness of 'Socrates' and make it red. And although in English we have given a linguistic role to 'Plato' (as representing Plato), we have not given any role to the property of a name which it acquires when we write 'Plato' to the right of it. That is why a mere list of names does not hang together to make a statement.

Wittgenstein generalizes this idea to claim that the formal properties of any element of the world, that is, the properties which fix its potential for combining into facts with other elements, must be mirrored in the formal properties of the linguistic component which represents it. So the kind of item which says something, and which we often wrongly think to be a complex object, is really a fact. In a sentence certain linguistic components are put together experimentally in a structure which mirrors the formal structure of some possible state of affairs (see THEORY OF TYPES).

4 Negation and tautology

This account does away with the need for a theory of types and Wittgenstein holds that the ideas invoked by Russell to explain the nature of logical truth are similarly unnecessary. Russell's view was that logical truths, such as that all sentences of the form 'p or not p' are true, should be explained by pointing to relations holding between some very abstract kind of logical items – negation, disjunction and the like.

Wittgenstein maintains that the negation sign is not a component of a sentence and so does not represent any element of a possible fact (in the quasi-technical sense of 'component', 'element' and 'represent' introduced above). Rather it is the visible mark of an operation one can perform on a meaningful sentence to produce another sentence. The role of the second sentence is to deny that things are as they would need to be to make the first sentence true.

To see the force of this, we must look again at the account of truth given above. What makes a negative sentence true is not the presence of some 'not-ness' in a fact but rather the absence of that (the combination of elements) which would have made the unnegated sentence true. Similar accounts are to be given of the other so-called logical constants. Thus 'or' does not stand for a possible element in a fact but is a sign by which one can correctly link two sentences if the components of either are so combined as to yield a truth.

Logical tautologies thus do not reveal the nature of special logical objects. Such sentences as 'It is raining or it is not raining' do not say anything. But their possibility is a corollary of the existence of a language adequate to say the kind of thing which can be said. So contemplating them can draw our attention to the logical structure of the world (see LOGICAL CONSTANTS).

5 Simples

The ideas outlined in the last two sections are already present in the sets of notes which Wittgenstein wrote in late 1913 and 1914. But the *Tractatus* in its complete form incorporated several further important ideas. One of these, perhaps adopted from Frege, is the view that sense must be determinate, that is, that every meaningful sentence must be either true or false in every possible state of affairs. But Wittgenstein differs from Frege in thinking that ordinary language, although misleading in surface form, is in order, and so already fulfils this condition of determinacy.

Determinacy entails that there must be what Wittgenstein calls 'objects', that is, utterly simple, eternal and unalterable elements, out of which all facts are composed. Moreover the links between our language system and reality must be set in place at this basic level. Suppose that language-world links were set up so as to connect a basic linguistic component with some element of reality which was not basic. The existence of this element would be contingent and would depend upon some simpler elements being suitably combined in a fact. A sentence containing this imagined basic component is clearly not true in a world where the simpler elements are not suitably combined. But it is equally unhappy to say that it is false, because the component itself does not specify what the simpler elements are or that they must be combined, and so it is no part of its meaning that their failure to be combined is relevant to its falsehood. To insist on the undefinability of this imagined basic element of language is to insist that it has meaning only through its connection with the item it represents. So in a world lacking that item it has no meaning, and sentences containing it are neither true nor false. But this, given the assumption of determinacy of sense, is a *reductio ad absurdum* of the idea that meaning can be conferred in this imagined way.

We may have an apparently basic sentence component which is linked to a contingently existing item (for example 'Socrates' as a name of Socrates). But this is only possible because a definition of that component can be given in our language system. The link between Socrates and his name is thus not a basic point of attachment between language and the world (contrary to the impression given in our earlier rough-and-ready example). It is a consequence of these ideas that there must be a complete analysis of every sentence

of our language which reveals it to be a truth-functional combination of elementary propositions, the components of which are simple signs representing objects.

But what are these simple objects? Wittgenstein, like Russell but unlike Frege, does not allow for any contrast between sense and reference within the meaning possessed by names of simples. This puts one demand on simples: they cannot be items with distinguishable aspects, that is, items which can be conceived of in several logically distinct ways. If they were, then there would also be the possibility of one name for a simple as conceived one way and another non-synonymous name for it as conceived another way – contrary to the denial of the sense-reference distinction. So a simple is the kind of thing which, if apprehended in such a way that it can be named, is apprehended exactly as it is in its entirety.

In so far as Wittgenstein drops any hints, it is that simples are phenomenally presented items, such as points in the sensory field and the properties they have, for example, shades of experienced colour. But he cannot give this answer officially because to do so would clash with another of the themes brought to prominence in the later development of the *Tractatus*. This is the claim that all necessity is logical necessity, and hence would be revealed as tautological in a complete analysis (see §7). A corollary of this is that all atomic facts are independent of each other and no elementary proposition can entail or be the contrary of any other. Such things as colours cannot then be 'objects' because attribution of different colours to one thing, as in 'a is red' and 'a is green', produces sentences which are contraries.

The topics so far discussed are treated primarily in the remarks following the main sentences numbered 2, 3 and 4. The remarks following 5 and 6 deal mainly with implications of this atomist conception for certain issues in logic (generality and identity for example) and for the nature of science, mathematics and statements of probability. On the last mentioned subject, Wittgenstein's brief remarks are one important source for the approach later developed by Rudolf Carnap (see CARNAP, R.; LOGICAL ATOMISM).

6 Thought, self and value

Wittgenstein writes, 'There is no such thing as the subject that thinks or entertains ideas' (5.631). His grounds for this are similar to those of Hume, namely that a unified, conscious self cannot be an element in any encountered fact. Hence no such item can be among those objects represented in thought. So reports of the form 'A believes that p', which seem to mention such a subject, are really of the form '"p" says that p'. They report the existence of a sentential complex, the components of which are correlated with the elements of the potential fact that p. There are then no selves in the contingent, encountered world but, at best, bundles of sentence-like items.

But Wittgenstein does not discard the notion of subject completely. The notion he rejects is that of the subject 'as conceived in psychology'. But the notion of the 'metaphysical' subject he thinks important. On this latter he says, 'What the solipsist means is quite correct; only it cannot be said but makes itself manifest' (5.62), and 'The subject does not belong to the world: rather, it is a limit of the world' (5.632).

One reading of this sees it as holding that I cannot prise apart the world and my experience of it. My own experience is directly available to me and any claim I make about the world must at the same time articulate that experience. Others' experiences, by contrast, are available to me only through noises or movements in my world. Another interpretation stresses the idea that a representation is always from a point of view which is not represented in it. A third view connects these remarks with the idea of projection. Wittgenstein speaks of using a propositional sign as a projection of a possible situation by thinking out its sense. So a subject might be the origin of the lines of projection which link representing items with what they represent and whose existence is thus presupposed by their meaningfulness. 'The world is *my* world: this is manifest in the fact that the limits of *language* (of that language which alone I understand) mean the limit of *my* world' (5.62). So perhaps Wittgenstein's idea is that the existence of a unique self (me) at the limit of the world is shown by the existence of representations which are meaningful to me.

Wittgenstein also offers, in the closing pages of the *Tractatus*, a number of gnomic remarks about value, death and the mystical, among them that no value exists in the world, that ethics cannot be put into words, that the will as a subject of ethical attributes cannot alter facts but only the limits of the world, that at death the world does not alter but comes to an end, that feeling the world as a limited whole is the mystical and that the solution of the problem of life is seen in the vanishing of the problem. These claims are to some extent intelligibly grounded in ideas concerning the self and what can be said. But they also represent a leap of development beyond those, a leap which comes in part from Wittgenstein's experiences in the First World War and the religious convictions to which his always intense and serious outlook then led him.

7 Saying and showing

Wittgenstein says that by reading the *Tractatus* one may come to grasp certain things about the nature of meaning, reality and value, among them the kinds of things outlined above. But he also claims that these things cannot be *said* but only *shown*, and that the attempt to say them ends up producing nonsense (6.54). Most of the *Tractatus* itself is thus nonsense. This claim is highly paradoxical and may seem to be unnecessary and grandiose mysticism, especially when viewed as part of the same package as the difficult remarks about the will and solipsism. But this is unfair. In many of its applications, the claim is well motivated, given the picture theory of meaning (see §3).

Most of the linguistic manoeuvres which Wittgenstein condemns as nonsensical are attempts to say things which are both necessary but also substantive – that is, not mere tautologies. Thus they include moves to assign elements of reality or language to their logical types ('Socrates is a particular'), related attempts to describe the logical forms of sentences or facts and also efforts to list the simples. (Claims about what is valuable could also have this status of seeming to be both substantial and necessary.) But if the picture theory of meaning holds in complete generality there cannot be such statable necessary truths. To say, for example, that object b is F we require that there be a linguistic representative of b ('b') and one of F-ness (the property of having 'F' to the right) which can be combined or not, just as b and F-ness can be combined or not. There must be complexity and there must therefore be the possibility of dissociation as well as association. But if b and F-ness necessarily go together (for example, Socrates must be a particular) then b cannot be dissociated from F-ness and it is a confusion to imagine that its being F is a fact with a composite structure. Hence it is also a confusion to imagine that it is something of the kind which can be said, on the account of saying which is offered by the picture theory.

8 Variant interpretations of the Tractatus

The above account summarizes what the *Tractatus* seems to say. Wittgenstein's overall intention in writing it is disputed. One traditional 'metaphysical' reading takes him to present a strongly realist outlook. There is a world of simple objects with a determinate structure independent of thought and this structure constrains and explains the nature of meaningful representation. We cannot say what this structure is, or describe the relation between reality and language. But the *Tractatus* aims to show us these things.

A second 'therapeutic' reading sees Wittgenstein as seeking to undermine the temptation to make such metaphysical claims. '"Is wise" is wise' is plain nonsense, like 'Frabble is wise', because we have given no meaning to 'is wise' as a referring expression. No further explanation of its nonsensicality is needed or could be given. The attempt to find one, by appeal to some further fact about the nature of what predicates represent merely leads us to formulate more nonsensical verbiage. We may explore the form of our language from the inside but we cannot explain that form by appeal to something external to it. Reflection on the articulation of reality must at the same time be reflection on the articulation of representation since the idea of reality can only be the idea of what makes representations true. 'What is not representable by meaningful representations' can only mean 'what is represented by nonsense'. But nonsense represents nothing.

Defenders of this second interpretation believe that Wittgenstein's intention in writing the *Tractatus* was to release us from the temptation to fruitless philosophical theorizing. Some of them also believe that Wittgenstein intends the completion of the therapy to be relinquishing the show–say distinction itself as nonsensical, and hence relinquishing also the idea of there being any insights to be gained by reading the book. In favour of this so-called 'resolute' interpretation are the facts that some therapeutic intentions are plainly embodied in the work and that Wittgenstein's project looks inconsistent without the final move. He strives to make apparent to us what he takes to be the requirements for any speech to be meaningful, namely that it be capable of picturing contingent states of affairs. Can it be that he then, in all seriousness, suggests that there are linguistic moves by which things are shown (moves which are therefore meaningful in some sense) which do not meet the requirements?

Against the resolute reading one may note that the removal of a muddle which hinders fruitful thought may also present itself as an increase in self-understanding or a coming to know better how to think. The process of reflection which dissolves the muddle and the better view it results in may both have natural verbal expressions. Wittgenstein's *Tractatus* view of language, as solely a system for picturing contingent states of affairs, does not allow for the meaningfulness of such utterances. But his later view recognises a greater variety of kinds of meaningful speech, including (for example) utterances which have the form of indicative statements but whose role is that of acknowledgements of rules of language. We may thus think of Wittgenstein in the *Tractatus* as either irresolute and inconsistent but in practice already recognizing the variety of human

discourse, or as resolute and consistent but closing his eyes to that variety.

The *Tractatus*, whether read in a metaphysical or a therapeutic way, shows Wittgenstein gripped by the conviction that there is just one set of possible concepts. The basic constituents of thought and of reality are, he takes it, fixed once and for all, independent of any contingencies of the interests and circumstances of human beings. And sentences have an analysis which if spelt out would make clear to us something we are not now (explicitly) aware of, namely the nature of the fundamental objects which compose states of affairs and which are represented by the simple signs of any meaningful language. These commitments – to analysis, objects and simplicity – themselves embody substantial philosophical claims and they provide central targets for Wittgenstein's later reconsiderations.

9 *Transition*

At the time of writing the *Tractatus* Wittgenstein took a lofty tone about simple objects; he had proved that they existed and it was of no importance that we cannot say what they are. But in the first years of his return to philosophy in 1927–31 one thing which occupied his attention was the detailed workings of various parts of our language, notably those involved in talking of shape, length and colour and other observable properties of items around us. His aim in considering them was to fill in that earlier gap by giving an account of the fundamental features of both language and the world.

He soon became convinced that the idea of independent elementary propositions was indefensible. For example, the incompatibility of 'a is red' and 'a is green' cannot be explained (contrary to what he had urged in the *Tractatus*) by analysing the two propositions and showing that one contains some elementary proposition which contradicts an elementary proposition in the analysis of the other. Rather the whole collection of colour judgments come as one set, as the marks along the edge of a ruler come as a set. To measure an object we hold a ruler with its marks against the object, that is, in effect we hold up a whole set of possible judgments of length, and we read off which is correct; to see that one judgment is correct is to see at the same time that all the others are incorrect. Something similar holds for colour and for many other concepts, except that in these cases the 'ruler' is not physically present. The differences between concepts have to do with the logical shapes of their 'rulers' and with the different methods by which they are compared to reality.

Other topics which occupied Wittgenstein at this time were those of psychological phenomena and the use of the word 'I'. And he also worked extensively on the nature of mathematics. Ideas in common with those of the logical positivists are apparent in some of the writings of this time. Indeed the slogan known as the verification principle – 'the meaning of a proposition is its method of verification' – may have originated with Wittgenstein. But he found it impossible to accept this as a clear statement which could provide one of the starting points for elaborating a philosophical system. He was aware of further puzzles and was temperamentally incapable of putting them on one side for the purpose of building an intellectual construct which might be based on misapprehension and which failed to address questions which still perplexed him (see Logical positivism §§3–4; Vienna Circle).

10 *Dismantling the* Tractatus *picture*

Paragraphs 1–242 of the *Philosophical Investigations* (roughly the first third of the book) are generally agreed to provide the most focused presentation of some of the central ideas of Wittgenstein's later outlook, in the context of which his views on philosophy of mind, mathematics and epistemology can helpfully be seen. We may divide the paragraphs into three groups: §§1–88 raise a variety of interrelated difficulties for the outlook of the *Tractatus*, §§89–142 discuss the nature of logic, philosophy and truth, and §§143–242 contain the so-called rule-following considerations.

The first group has two main targets: first, the idea that most words have meaning in virtue of naming something and, second, the idea that meaning requires determinacy and so exactness. Against the former Wittgenstein points out that different words function in different ways. To understand 'five', for example, a person needs to be able to count and behave appropriately on the result of a counting; to understand a colour term might, by contrast, involve knowing how to compare the specimen to be judged with a sheet of samples. To teach language one must train a person to produce and respond to words in the context of everyday activities such as fetching things, measuring, building, buying and selling. We can throw light on meaning by reflecting on simple 'language games', involving such integration of speech and action. To say that every word names something is like saying that every tool in the tool box modifies something. We can describe things this way if we insist: 'The saw modifies the shape of the board; the ruler modifies our knowledge of a thing's length'. But such assimilation may lead us to overlook important variety rather than representing a useful insight. To get someone to understand a

word it is not enough to bring them face-to-face with the supposed referent while repeating the word. In order to profit from the confrontation, the learner must know what kind of word is being taught (for a number, shape, colour, and so on). And this in turn involves already being at home with the everyday activities into which remarks using the word are woven. 'For a *large* class of cases – though not for all – in which we employ the word meaning it can be defined thus: the meaning of a word is its use in the language' (Wittgenstein 1953: §43).

On the second topic Wittgenstein remarks that drawing a contrast between 'simple' and 'complex' depends upon context and interest. Items which might be seen as complex in one context could be taken as simple in another and vice versa. So these notions and the related notion of exactness are context-relative. A word does not become unusable and hence meaningless because its use is not everywhere bounded by rules. That we can imagine circumstances in which a given description would seem inappropriately vague or in which we would not know whether to say that it was true or false is no criticism of its current use and hence no argument that it does not have meaning. Thus the idea that every meaningful sentence must have some underlying analysis in terms of simples is mistaken.

Each sort of word is at home in its own language game. But there are not always clear-cut relations of subordination or dependence between different language games. There are many predicates (for example, 'intention', 'thought', 'statement', 'number', 'game') which clearly do not name simples, because they have interesting richness and apply to complex items. But it is not the case that such predicates must have an analysis in terms of 'simpler' predicates. Search for such an analysis may reveal instead a 'family resemblance'. Persons who recognizably belong to the same family may have various resemblances, of build, features, colour of eyes, gait, temperament and so on, which 'form a complicated network of similarities, overlapping and criss-crossing' (1953: §66), without one set of such resemblances being necessary and sufficient for having the appearance of a member of that family.

On the basis of this survey of the actual workings of language, Wittgenstein then concludes that the *Tractatus* picture of a detailed crystalline structure present in both world and language is an illusion.

But perhaps the considerations outlined require only minor tinkering with the *Tractatus* picture? We might say: 'Certainly linguistic representations of states of affairs are put to various uses, in commands, jokes, stories etc., as well as in straight reports; also what degree of exactness we need is fixed by context; hence we should accept that for many practical purposes vague remarks are adequate. But none of this shows that we must discard the *Tractatus* picture of a fully determinate world, structured by simples; nor does it show that the idea of constructing a complete and exhaustive description of it need be abandoned. All it shows is that our everyday language mirrors the world less accurately than an imaginable ideal scientific language.' That such a reading is inadequate is shown by considering the remarks on rule-following found in paragraphs 143–242.

11 Rule-following

By 'rule' Wittgenstein does not mean an abstract standard according to which some act may be judged right or wrong. Rather he means a concrete item, such as a noise, mark or gesture, which is presented to a person and by attending to which they direct their behaviour, the link between rule and response being learned and conventional. An enormous number of human activities can be seen as instances of rule-following. They include imitating the gestures and noises which others make, copying shapes, converting marks into noises as in reading music, chanting the number sounds in sequence, and so on. More generally, both non-verbal behaviour in response to verbal instruction (fetching a book when told to do so) and also producing linguistic reports (where the world itself is the guide and the utterance is the response) may be described as rule-following. Rule-following is thus at the heart of linguistic competence. If we further accept that coming to use a rich and expressive language is an indispensable part of coming to grasp complex concepts and to make reflective judgments, then rule-following is also at the heart of our lives as thinking creatures.

It is generally agreed that Wittgenstein has telling negative points to make about one attractive but misleading picture of rule-following. On this picture, to understand a rule, for example, to grasp what is meant by 'Add two', it is necessary and sufficient to have a certain sort of item, an image, feeling or formula, occur in the mind when the instruction is heard. For example, having a mental image of two blocks appearing at the end of a line of blocks is the sort of thing which might be imagined to constitute understanding 'Add two'. This image is supposed to do two things. First, it helps bring about that the person goes on to produce a particular response, for example saying 'Eight' if the previously given number was six; second, it sets a standard by which that response can be judged correct or incorrect.

But the picture will not do. A person might have such an image while responding to 'Add two' as if it

meant ‘Multiply by two’. Moreover their behaviour (the regular patterns of action, what seems to be regarded as a mistake, and so on) could show that for them, ‘Add two’ actually means ‘Multiply by two’. So images guarantee neither subsequent behaviour nor the appropriateness of a particular standard of assessment.

What this case makes us see is that an image, feeling or formula is merely another rule-like object (that is, a potential vehicle of meaning) rather than the meaning itself. An item is not automatically a self-interpreting sign, that is, one which fixes and enforces a certain reading of itself, simply in virtue of existing in the mind rather than in the outer public world. So images and the like are not sufficient for understanding; but neither are they necessary, since in many cases they do not occur. Typically when someone responds to everyday and familiar language they just act unhesitatingly and spontaneously, without consulting any inner item.

To teach someone to follow a rule, for example to understand ‘Add two’, we put them through a finite amount of training, primarily by working through examples of adding two. These examples may appear to be another resource for pinning down meaning. But being only finite in number, they are bound to have more than one feature in common. Thus they do not themselves determine a unique interpretation for the sign we associate with them. A learner might exhibit a future bizarre divergence from what is expected, for instance by saying that adding two to 1,000 yields 1,004. And if this occurred it would suggest that they had all along been struck by some feature other than the one intended.

The central point here is that, for there to be meaning, the rule-followers must have fixed on one rather than another of the various similarities between the teaching examples and have associated it with the rule, that is, with the mark or sign to which they respond. ‘The use of the word rule and the use of the word same are interwoven’ (1953: §224). But neither the examples nor the rule itself determine which similarity this is; and imagined inner surrogates, in which we would like to see the relevant resemblance encapsulated, turn out to be equally inefficacious.

These reflections do not just undermine one picture of the psychology of understanding. They are also relevant to the picture presented by the *Tractatus*. If there were a fixed structure for world and language as envisaged in the *Tractatus*, then there would exist items, namely the simple objects, which would fix the one and only absolute standard of similarity. If there is a simple which is a common element in two separate facts then there is a basic real resemblance between those facts; if not, not. Every other real resemblance which can be meaningfully labelled, for example by the predicates of everyday language or science, must be founded in simples. A putative linguistic expression which is not tied to some definite combination of simples is, on the *Tractatus* view, an expression without meaning which is merely randomly applied. Further, as we saw earlier, a simple is the kind of thing which, when apprehended, must be apprehended as it is. So representing a simple, whether by a direct cognition of it or by having in mind something which encapsulates its nature, is to be aware of a self-interpreting item, something which dictates what is to count as ‘the same’. But this sort of confrontation is what the rule-following considerations suggest to be unintelligible.

Thus the discussions of §§143–242 can be seen as interweaving with and reinforcing those of §§1–88. The whole undermines not only the idea of closeness of fit between a *Tractatus* world and everyday language, but the underlying conception of that world itself, namely as already determinately articulated into facts by simples which we can apprehend (see Meaning and rule-following).

12 The later picture of meaning

The *Tractatus* offers us a world articulated, independently of our detailed human concerns, into value-free facts which are the subject matter of the natural sciences together with a mind confronting that world and attempting to mirror it in its thoughts. It also tells us that there is (in some sense) only one subject and that it is an item at the limit of the world which cannot act responsibly in the world.

However attractive the first element here, everyone would agree that there is something seriously wrong with the solipsism of the second. So one essential move in amendment is to reintegrate the psychological and the metaphysical subjects of the *Tractatus*, by making the self responsibly active, bringing it in from the limit and locating it firmly in the world, together with other selves. We may do this while leaving in place the idea of the world as the totality of value-free facts. Then the existence of the self which is now located in the world must be some subset of such facts. This yields an extremely powerful and attractive overall picture, namely the picture of reductive naturalism. But it also generates many philosophical puzzles, those to do, for example, with giving naturalistic accounts of consciousness, free will, rationality and so on.

This overall picture cannot be Wittgenstein’s, however, if §11 is right in its reading of the rule-following considerations. The idea of an independently articulated world is not acceptable to him.

We cannot understand our concepts by pointing to simples which reveal themselves as the ultimate constituents in any world and so make evident to us the necessity and defensibility of our way of thinking. To understand meaning we must look at use, at how our actions and concepts are interwoven. The fact that makes a sentence true is grasped through seeing when the sentence is correctly used, and that in turn is grasped only by seeing the full shape of the language games in which it is used. For a concept to be truly applicable to the world, and so for its corresponding property to have instances, is not for it to pick out some simple which is among the timelessly given building-blocks of all worlds. Rather it is for the life of which use of that concept is a part to be liveable in this world. Wittgenstein thus moves from a form of the correspondence theory of truth in the *Tractatus* to a redundancy theory in the *Investigations* (see Truth, correspondence theory of; Truth, deflationary theories of).

The self need not, on this view, be an assemblage of value-free facts. Neither need we conceive it as a unique metaphysical limit to the world. It is rather a living, human locus of abilities, a person who can be trained to follow rules, to use and respond to language, in the way that normal humans can. And since concepts are aspects of our way of life rather than items built into the one conceptual scheme and underpinned by simple objects, understanding what it is to have a particular concept involves 'assembling reminders' about how it works for us and how our various activities and ways of talking build together into our way of life.

If it is correct to conceive of understanding as an ability, then the exercise of this ability in everyday situations will often be just some confident, spontaneous action or utterance, which the subject will not be able to justify by pointing to something, other than the situation or words responded to, which guided them.

> 'How am I able to obey a rule?' – if this is not a question about causes, then it is about the justification for my following the rule in the way I do. If I have exhausted the justification I have reached bedrock and my spade is turned. Then I am inclined to say: 'This is simply what I do'.
>
> (1953: §217)

But this need not worry us. 'To use a word without justification does not mean to use it without right' (1953: §289). The fact is that we do find such confident and unhesitating responses in ourselves. Also we (usually) agree with others; and where we do not we (usually) agree on how to settle the dispute. So we have no reason to doubt that in general we do indeed mean what we take ourselves to mean.

Indeed we can put things more strongly than this. It is not just that it is sensible, practically speaking, for me to make a leap of faith and decide to carry on as if I and others mean what it seems we mean. We have no more choice about this than we do about taking 'Eight' to be the right response to 'Add two to six'. The language game of ascribing meanings to the remarks of ourselves and others is as central and indispensable to a recognizably human life as anything in our linguistic repertoire. Moreover the rich and complex social world in which we find ourselves sustains our practice of so doing. So we and our meanings are just as much part of the world as the stars, rocks and trees around us. And since we are no longer committed to the idea of one totality of facts, those of value-free natural science, this recognition does not now produce cramps or pressures to reductive manoeuvres (see Private states and language).

13 Alternative readings

The account of §§10–12 presents Wittgenstein as inviting us to abandon the idea of our meanings and judgments being securely moored to something given to us and for which we have no responsibility. We see that there is no guarantee of any unique conceptual scheme to be revealed by analysis, or of a world articulated once and for all in terms of its categories. We are instead to become aware of our involvement in and responsibility for our own judgments and the way of life of which they are part. We are also to acknowledge that we cannot prove the unique correctness of our way of life and its associated concepts. (The arguments of the *Investigations* against the position of the *Tractatus* thus have much in common with themes explored by other late-nineteenth-century and twentieth-century thinkers, such as Nietzsche, William James, Heidegger, Quine and Derrida (see Nietzsche, F.; Heidegger, M. §§2–4; Quine, W.V. §5).) But, the reading given in §12 implicitly suggests, this need not lead us to scepticism about the notions of meaning, fact, objectivity or truth.

This interpretation, although not idiosyncratic, is by no means generally accepted. There are a large number of differing construals of Wittgenstein's overall intention, many of which have in common that they present the consequences of abandoning the *Tractatus* view as more radical and/or more deflationary than is suggested in §12.

One interpretation stresses a contrast between the *Tractatus* and the later writings which is different from any highlighted earlier. It takes the rule-following considerations to show that we cannot

make sense of a grasp of meaning which fixes truth conditions independent of our ability to verify that they obtain. The later Wittgenstein is thought to insist (as against his earlier self) that all meaning be explicated by appeal to assertibility conditions rather than such possibly verification-transcendent truth conditions, and he is recruited onto the antirealist side of the debate in the dispute between realism and antirealism.

Another much discussed view is presented by Saul KRIPKE. If there were facts about meaning, he argues, they would have to be constituted by something about past behaviour or present occurrences in the mind. So §§143–242 can be read as showing that there are no facts about meaning. Our practice of labelling remarks 'correct' or 'incorrect' and ascribing 'meanings' to them has a role in our social life. But such linguistic moves do not have truth conditions. Instead they have only appropriateness conditions. We are licensed to make them when others in our community keep in step with us in certain ways in their patterns of utterance.

Yet a third interpretation takes it that Wittgenstein espouses relativism. One response to the idea that there are no simples is to take it that the world is a featureless mush or unknowable something. Any apparent structure in it is then imposed by us. Hence the familiar physical and social world we experience is a creation of ours. But there are several possible but incompatible ways of imposing structure, one of which we are physiologically and/or socially caused to adopt. So no judgment can claim to be 'true' in a non-relative sense; at best it can be 'true for us'.

An important issue in assessing this third view is what status Wittgenstein intended for the sketched alternative ways of responding to language teaching. Certainly they need enough feasibility to dislodge the conviction that there is one and only one possible way of dividing up the world. On the other hand it is not clear that he takes us to be entitled to assert that there are conceptual schemes which are both incompatible with ours and also fully possible.

Many other readings are also possible, detecting in his writings elements of pragmatism, behaviourism and even deconstructionism (see BEHAVIOURISM, ANALYTIC; DECONSTRUCTION; PRAGMATISM §2; REALISM AND ANTIREALISM §4; RELATIVISM).

A general question is whether Wittgenstein should be read as a philosophical theorist or as a therapist offering to relieve us of the impulse to construct philosophical theories. To take him to be offering anti-realist, sceptical or relativist views is to see him as a theorist. Those who read him as a theorist in his later work are also likely to favour a metaphysical reading of the *Tractatus*, seeing it too as expressing a philosophical theory, for example some version of realism. Other commentators (representing a mainstream view) see him as shifting from a theoretical stance in the *Tractatus* to a therapeutic one in the later work. Yet a third group favours a therapeutic reading of his intentions throughout and believes that the ideas offered in the *Tractatus* are much more similar to those of the later work than is often supposed.

This entry assumes that the second approach is right, at least in that the *Tractatus* embodies commitments which are, in effect, theoretical and which Wittgenstein later recognized and criticized as such. But it allows also that the third group may well be correct in thinking that Wittgenstein's overt intentions always had a therapeutic aspect. (It may also be that the distinction between theory and therapy is less clear-cut than previously assumed.)

14 Philosophy of mind

The *Tractatus* picture of the relation of language to its subject matter is especially attractive in the case of some psychological notions. A sensation such as pain is easily conceived as a phenomenon which impresses its nature and identity conditions on one who has it, independent of external circumstances or bodily behaviour. The private language argument (§§243–71) examines this idea in the light of the earlier discussion of meaning. One aim is to show that our actual use of terms for sensations does not and could not conform to the pattern suggested.

The rule-following considerations suggest that no standard for what is to count as 'the same' can be fixed merely by uttering a word to oneself while being vividly aware of what one experiences. For one kind of item rather than another to come into focus out of the indefinite variety potentially presented in an experience, that experience must be embedded in one kind of life rather than another. Relatedly, for a word to have meaning there must be some extended practice in which its use has a point. This is as true of sensation words as of any others. We teach and use them in a complex setting of physical circumstances and expressive bodily behaviour. This setting, says Wittgenstein, is not externally and contingently linked to sensation but is an integral part of the sort of life in which the general category 'sensation' makes sense and in which particular sensations can be individuated.

Wittgenstein considers many other topics in philosophical psychology, among them intention, expectation, calculating in the head, belief, dreaming and aspect perception. A constant theme is the need to counter the attraction of the model of name and object, which (together with such things as the special authority which each person has to pronounce on their own psychological states) leads us

to conceive of the 'inner' as a special mysterious realm, distinct from the 'outer' or physical. He offers such general remarks as 'An inner process stands in need of outward criteria' (1953: §580). He also returns repeatedly to the idea that authoritative first-person psychological claims should be seen as expressions or avowals of those states which we are inclined to insist that they describe. These sorts of moves have led to the idea that he denies the existence of the 'inner' and is really a behaviourist.

Wittgenstein was aware of the risk of this reading:

> 'But you will surely admit that there is a difference between pain-behaviour accompanied by pain and pain-behaviour without any pain?' – Admit it? What greater difference could there be? – 'And yet you again and again reach the conclusion that the sensation itself is a *nothing*.' Not at all. It is not a *something*, but not a *nothing* either!
>
> (1953: §304)

Thoughts and experiences are, on his view, necessarily linked to expressive behaviour. 'Only of a living human being and what resembles (behaves like) a living human being can one say: it has sensations; it sees; is blind; hears; is deaf; is conscious or unconscious' (1953: §281). But this does not mean either that any reduction of the mental to the behavioural is possible or that the psychological is not real. To see Wittgenstein's view sympathetically it is important to keep in mind the upshot of §§1–242. There is no a priori guarantee of some privileged set of classifications (for instance, those of natural science) in terms of which all others must be explained. To understand any phenomenon we must get a clear view of the language games in which terms for it are used; and the logical shapes of these may be very different from those which are initially suggested by the pictures which grip us (see Private language argument).

15 Philosophy of mathematics

Platonism in mathematics involves two claims, that there is a realm of necessary facts independent of human thought and that these facts may outrun our ability to get access to them by proofs. Platonism is attractive because it accounts for several striking features of mathematical experience: first that proofs are compelling and yet may have conclusions which are surprising, and second that we seem to be able to understand some mathematical propositions without having any guarantee that proofs of them exist.

Wittgenstein never accepted Platonism because he always took the view that making substantive statements is one thing, while articulating the rules for making them is another. So-called necessary truths clearly do present rules of language, inasmuch as accepting them commits one to allowing and disallowing certain linguistic moves. Wittgenstein holds that it is therefore a muddle to think that such formulations describe some particularly hard and immovable states of affairs. Thus in the *Tractatus* mathematical propositions are treated together with tautologies as sets of signs which say nothing, but show the logic of the world.

Nevertheless the *Tractatus* view has some kind of affinity with at least the first claim in Platonism, inasmuch as the rules of our language, on which mathematics rest, are rules of the only logically possible language. But when Wittgenstein comes to see linguistic rules as features internal to our (possibly varying) practices, the resulting picture is unwelcoming even to this. We cannot now assume there to be such a thing as 'the logic of the world', whether to be shown or said. Instead, in *Remarks on the Foundations of Mathematics*, he explores ideas of the following kinds.

At a given time we have linguistic practices directed by certain rules. Someone may now produce a proof of a formula which if accepted would be a new rule – for example, '14 + 3 = 17'. It is natural to think that to accept this is to unpack what we were already committed to by our understanding of '17', '+', and so on. But the rule-following considerations unsettle this assumption because they undermine the idea of an intellectual confrontation with an abstract item which forces awareness of its nature upon us and they also bring to our attention the element of spontaneity in any new application of a given term. Rather to accept the proof and its outcome is to change our practices of applying signs like '17', because it is to adopt a new criterion for judging that seventeen things are present, namely that there are two groups of fourteen and three. Hence to accept the proof is to alter our concepts. What makes mathematics possible is that we nearly all agree in our reaction to proofs, and in finding them compelling. But to seek to explain this by pointing to Platonic structures is to fall back into incoherent mythology.

The present author's own view is that it is persistent uneasiness with the first claim in Platonism which primarily motivates Wittgenstein's reflections on mathematics. But those who see him as an antirealist will put more stress on hostility to the second claim (the idea of verification transcendence) and certainly some of Wittgenstein's remarks (for example, his suspicion of the application of the law of excluded middle to mathematical propositions) have affinities with ideas in intuitionistic

logic. A third reading will bring out the conventionalist-sounding elements, on which we choose what linguistic rules to adopt on pragmatic grounds.

In addition to reflections on the nature and use of elementary arithmetical claims, Wittgenstein also applies his ideas to some more complex constructs in mathematical logic, such as the Frege–Russell project of deriving mathematics from logic, Cantor's diagonal argument to the non-denumerability of the real numbers, consistency proofs and Gödel's theorem. His general line here is not that there is anything wrong with the mathematics but that the results have been misconstrued, because they have been interpreted against a mistaken background Platonism. Some mathematical logicians claim that Wittgenstein has not understood properly what he is discussing. His views on consistency and Gödel in particular have aroused annoyance (see Intuitionism).

16 Ethics, aesthetics and philosophy of religion

In the *Tractatus* Wittgenstein consigns ethics to the realm of the unsayable, and he takes the same line in his 'Lecture on Ethics' (1929). Here he says that ethics (which he links to aesthetics and religion) arises from a tendency in the human mind to try to express in words something – roughly the existence and nature of absolute value – which seems to manifest itself to us in certain experiences. (He gives as an instance the experience of finding the existence of the world miraculous.) It is essential to this impulse that it seeks to go beyond the world and significant language; so it is bound to issue in utterances which are nonsensical. Nevertheless, he says, he has the greatest respect for this impulse and would not for his life ridicule it.

This position resembles the emotivism associated with logical positivism in distinguishing ethical utterances sharply from those of science (that is, those which are capable of rational assessment, and can be true or false). But it also differs from it in being, in spirit, an ethical realism, albeit of a mystical kind.

In his later writing Wittgenstein rethought his views on meaning, mathematics and the mind but did not return to any sustained discussion of ethics or aesthetics (although there are scattered remarks, particularly on the aesthetics of music, in *Culture and Value* (1980)). One interpretation of the later outlook, however, provides a hospitable setting for an ethical realism of a less mysterious kind, one which allows for the statement and rational discussion of truth-evaluable ethical claims. Philosophers of meta-ethics taking themselves to be working within a Wittgensteinian outlook have urged that our inclination to insist on a dichotomy between fact and value, or between cognition and feeling, should be resisted, as the outcome of the grip on us of some misapplied picture. Moreover Wittgenstein's emphasis on attention to the actual workings of language could encourage a distinctive approach to first order ethical questions. But he himself never developed this position, nor does he engage with issues in political philosophy.

The later outlook enjoins us to study each distinctive area of language as far as possible without preconceptions. If we do this for religious language, Wittgenstein holds, we shall see that religion is not a kind of science and hence is not open to criticism on the grounds that, as science, it is unconvincing (see, for example, 'Remarks on Frazer's *Golden Bough*' (1931)). Some take it that this implies that no religious utterance can be properly subject to any criticism other than that coming from inside the same religious community or tradition.

17 Epistemology

One familiar traditional philosophical problem is that of scepticism, that is, whether we can rightly claim to know such things as that physical objects exist independent of our perception, that the world was not created five minutes ago and so forth.

Wittgenstein's most extended discussion of these issues is in *On Certainty* (1969). He starts from the kinds of examples invoked by G.E. Moore in his attempt to combat scepticism, such as 'Here is a hand' and 'The Earth has existed for a long time before my birth'. Moore is wrong, Wittgenstein thinks, in taking it that we are plainly entitled to assert that we know these things. But Moore is right in thinking that the claims form an interesting class. It is impossible to conduct life and thought without taking some things entirely for granted, and the propositions Moore identifies are the articulated forms of things which play this role for us. They help to define our world picture and underpin the procedures by which other claims (ones that are in fact doubted and tested) can be assessed. But they cannot themselves be assessed because there is nothing relatively more certain by which we can get leverage on them. Someone who seems to doubt them is thought mad and, from a first-person point of view, when I imagine doubting such things I contemplate a situation in which I would no longer know how to reason about anything. There are close links between these themes and the idea that the workability of any language game presupposes certain very general facts of nature.

The relevance of this for the traditional question of scepticism is that it is, in its form, misconceived.

The central use of 'know' is in connection with propositions where testing is possible. Hence one who uses it in connection with the propositions which help define our worldview (as is in fact done only in philosophy and not in ordinary life) has extended the word to a situation where procedures do not exist for assessing either the first-order claim or the claim to knowledge of it. This is not to say that the word 'know' is unintelligibly and wrongly used in the philosophical debate. We can sympathize with the sceptical impulse, which springs from awareness of the fact that our language games are not based on grounds which compel us to adopt them or guarantee their continued success. But we can also sympathize with the anti-sceptical position which insists that acceptance of these central propositions underpins our being able to do any thinking at all, so that claims to doubt them are empty (see SCEPTICISM).

18 Wittgenstein's conception of philosophy

In two central respects Wittgenstein stands squarely within the main historical tradition of philosophy, first in the nature of the issues which excited and intrigued him intellectually – meaning, the self, consciousness, necessity – and second (going back to the roots of the tradition) in his being a 'lover of wisdom', that is, one who is seriously concerned about having a right stance to the world both intellectually and practically and who is committed to the use of the intellect (among other things) in helping to achieve this.

But he differs from many philosophers in his conviction that a great number of traditional philosophical problems are the result of some deep kind of muddle, and in his belief that the answers given and the way they are debated hinder rather than help us in achieving wisdom. This conviction gripped him from very early on and philosophical thought therefore presented itself to him as a tormentingly difficult struggle to be honest and to free himself from misleading preconceptions.

So the word 'philosophy' has, in all his writings, two uses. On one it describes a body of confused utterances and arguments, arising largely from misunderstanding of the workings of language, and on the other it describes an activity of helping people to get free of the muddles. Another important continuity is his insistence that there cannot be philosophical theories and that the helpful activity of philosophy ought only to consist of making uncontentious statements, of describing and assembling reminders. In the context of the picture theory of meaning, this is comprehensible (see §7). But it is less clear that it is required by the later view.

In part Wittgenstein is here stressing that we cannot have the kind of explanation of our concepts which the *Tractatus* picture seemed to promise. Our form of life cannot be grounded but only described and lived. In part he is questioning the impulse to look for quasi-scientific theories of the nature of philosophically puzzling phenomena. But these two interrelated points do not obviously add up to a complete embargo on anything which could be called 'philosophical theory'. It is in the spirit of the later philosophy to point out that there are many different kinds of things which can be called 'theories'. Everyone engaged in reflection on the topics Wittgenstein considers (including Wittgenstein himself) finds it natural to articulate in words the states they arrive at and to engage with these words and those of others in the mode of further comment and assessment.

We become aware here, and at many other places, of the open-ended and unfinished nature of Wittgenstein's reflections. His writings have aroused great devotion because of the honesty and depth which many find in them. But it is important not to treat them with superstitious reverence. Rather they should be read in the spirit in which he intended, namely as an invitation to explore with as much integrity as possible one's own perplexities and what would resolve them.

WOLFF, CHRISTIAN (1679–1754)

Christian Wolff was a rationalistic school philosopher in the German Enlightenment. During the period between the death of Leibniz (1716) and the publication of Kant's critical writings (1780s), Wolff was perhaps the most influential philosopher in Germany.

There are many reasons for this, including Wolff's voluminous writings in both German and Latin in nearly every field of philosophy known to his time, their unvarying employment of a strict rationalistic method to establish their conclusions, the attention directed to Wolff and his views as a result of bitter controversies with some theological colleagues, his banishment from Prussia by King Frederick Wilhelm I in 1723 and triumphant return from Hesse–Cassel in 1740 after Frederick the Great assumed the throne, and his active teaching at the Universities of Halle and Marburg for nearly fifty years. Through his work as a university professor, his prolific writings, and the rigour and comprehensiveness of his philosophy, Wolff influenced a very large group of followers, educators and other writers. Even after his influence had begun to wane, Kant still referred to 'the celebrated Wolff' and spoke of 'the strict method of the celebrated Wolff, the greatest of all dogmatic philosophers'.

Wolff thought of philosophy as that discipline which provides reasons to explain why things exist or occur and why they are even possible. Thus, he included within philosophy a much broader range of subjects than might now be recognized as 'philosophical'. Indeed, for Wolff all human knowledge consists of only three disciplines: history, mathematics and philosophy.

The reasons provided by Wolff's philosophy were to be established through unfailing adherence to a strict demonstrative method. Like Descartes, Wolff first discovered this method in mathematics, but he concluded that both mathematical and philosophical methods had their ultimate origins in a 'natural logic' prescribed to the human mind by God. In fact, the heart of Wolff's philosophical method is a deductive logic making use of syllogistic arguments.

For Wolff, the immediate objective of philosophical method is to achieve certitude by establishing an order of truths within each discipline and a system within human knowledge as a whole. The ultimate goal is to establish a reliable foundation for the conduct of human affairs and the enlargement of knowledge.

Wolff applied his philosophical method unfailingly in each of the three principal parts of philosophy: metaphysics – knowledge of those things which are possible through being in general, the world in general, human souls, and God; physics – knowledge of those things which are possible through bodies; and practical philosophy – knowledge of those things which are concerned with human actions. Wolff's philosophical system also includes logic, an art of discovery (to guide the investigation of hidden truth and the production of new insights), some experiential disciplines (for example, empirical psychology) and several bodies of philosophical knowledge that were not well developed in Wolff's time concerning law, medicine, and both the practical and liberal arts.

CHARLES A. CORR

WOLLSTONECRAFT, MARY (1759–97)

Wollstonecraft used the rationalist and egalitarian ideas of late eighteenth-century radical liberalism to attack the subjugation of women and to display its roots in the social construction of gender. Her political philosophy draws on Rousseau's philosophical anthropology, rational religion, and an original moral psychology which integrates reason and feeling in the production of virtue. Relations between men and women are corrupted by artificial gender distinctions, just as political relations are corrupted by artificial distinctions of rank, wealth and power. Conventional, artificial morality distinguishes between male and female virtue; true virtue is gender-neutral, consists in the imitation of God, and depends on the unimpeded development of natural faculties common to both sexes, including both reason and passion. Political justice and private virtue are interdependent: neither can advance without an advance in the other.

WORK, PHILOSOPHY OF

Unlike play, work is activity that has to involve significant expenditure of effort and be directed toward some goal beyond enjoyment. The term 'work' is also used to signify an individual's occupation, the means whereby they gain their livelihood. In modern market economies individuals contract to work for other individuals on specified terms. Beyond noting this formal freedom to choose how one shall work, critics of market economies have maintained that one's occupation

should be a realm of substantive freedom, in which work is freely chosen self-expression. Against this unalienated labour norm, others have held that the freedom of self-expression is one good among others that work can provide, such as lucrative pay, friendly social contact and the satisfaction of the self-support norm, and that none of these various work-related goods necessarily should have priority over others. Some philosophers place responsibility on society for providing opportunities for good work for all members of society; others hold that the responsibility for the quality of one's occupational life appropriately falls on each individual alone. Finally, some theorists of work emphasize that performance of hard work renders one deserving of property ownership (John Locke) or enhances one's spiritual development (Mahatma Gandhi).

WUNDT, WILHELM (1832–1920)

The German philosopher, psychologist and physician Wilhelm Wundt founded the world's first psychological laboratory in Leipzig in 1879 – at a time when psychology was still generally regarded as a theoretical and institutional part of philosophy. This event typified his life's work and its reception in many respects. On the one hand Wundt tried to develop psychology as an independent science by defining its subject matter and methodology; on the other, he wanted to integrate psychology into the context of philosophy, cultural theory and history. With both attempts he acquired world fame and at the same time became a most controversial figure. Systematizing his approach, Wundt worked on a great amount of material in very different disciplines. He has been called the last philosophical 'polyhistor' in the tradition of Leibniz and Hegel, as well as the first modern scientist in psychology.

JENS BROCKMEIER

WYCLIF, JOHN (*c.*1330–84)

John Wyclif was a logician, theologian and religious reformer. A Yorkshireman educated at Oxford, he first came to prominence as a logician; he developed some technical notions of the Oxford Calculators, but reacted against their logic of terms to embrace with fervour the idea of the real existence of universal ideas. He expounded his view as a theologian, rejecting the notion of the annihilation of substance (including the eucharistic elements) and treating time as merely contingent. The proper understanding of universals became his touchstone of moral progress; treating scripture as a universal idea, he measured the value of human institutions, including the Church and its temporal property, by their conformity with its absolute truth. These views, though temporarily favoured by King Edward III, were condemned by Pope Gregory XI in 1377 and by the English ecclesiastical hierarchy in 1382, forcing him into retirement but leaving him to inspire a clandestine group of scholarly reformers, the Lollards.

XUNZI (*fl.* 298–238 BC)

Xunzi is one of the most brilliant Confucian thinkers of ancient China. His works display wide-ranging interest in such topics as the relation between morality and human nature, the ideal of the good human life, the nature of ethical discourse and argumentation, and the ethical uses of history, moral education and personal cultivation. Because of the comprehensive and systematic character of his philosophical concerns, Xunzi is sometimes compared to Aristotle. Noteworthy is his emphasis on *li*, or rules of proper conduct, and the holistic character of *dao*, the Confucian ideal of the good human life. He criticized other philosophers not because of their mistakes, but because of their preoccupation with one aspect of *dao* to the exclusion of others.

YIN–YANG

Yin and *yang* always describe the relationships that obtain among unique particulars. Originally these terms designated the shady side and the sunny side of a hill, and gradually came to suggest the way in which one thing 'overshadows' another in some particular aspect of their relationship. Any comparison between two or more unique particulars on any given topic is necessarily hierarchical: one side is *yang* and the other is *yin*. The nature of the opposition captured in this pairing expresses the mutuality, interdependence, hierarchical relationship, diversity and creative efficacy of the dynamic relationships that are immanent in and give value to the world. The full range of difference in the world is deemed explicable through this pairing.

Yin and *yang* are elements of a correlative pairing which are pragmatically useful in sorting out 'this' and 'that', and are not, as often claimed, dualistic principles of light and dark, male and female, action and passivity where light and dark both exclude each other and logically entail each other and, in their complementarity, constitute a totality. Rather, *yin* and *yang* are first and foremost a vocabulary of qualitative contrasts which have application to specific situations and enable us to make specific distinctions.

To bring this observation to bear on our understanding of *yin* and *yang*, we must start with the relationship that obtains between any two particular things or events. For example, in a given relationship, 'this' older woman might by virtue of her wisdom be regarded as *yang* in contrast to 'that' younger woman who is *yin*. However, if we were to focus on their fecundity or physical strength, the correlation would likely be the opposite. Important here is the primacy of the particular and the fluidity of the relationship. Although things in this world – that is, particular things – are resolutely hierarchical, no one thing excels in all respects, making this same hierarchy the basis for their complementarity.

In the classical Chinese world, things of the same 'kind' are not defined in terms of their essences as natural kinds but by virtue of their affinity or 'kinship' resemblances that associate them, their 'family resemblances'. Important here is the primacy of particular difference and the absence of any assumed sameness or strict identity. Things are deemed to have resemblances based upon analogous roles or functions. Thus one thing, by virtue of its relationships, evokes many. The suggestiveness of each phenomenon in calling up other similar phenomena is comparable to the multivalence of poetic images. Describing a particular phenomenon does not require the discovery of some underlying determinative and originative principle – a basis for making 'many' one – but a mapping out and an unravelling of the phenomenon's multiple correlations and of the relationships and conditions that make up its context. *Yin* and *yang* define the tension between multiple perspectives on phenomena, and they enable us to interpret and bring coherence to our circumstances by allowing us to discern the patterns in relationships within particular contexts. They provide a vocabulary for sorting out the relationships that obtain among things as they come together and constitute themselves in unique compositions.

Thus, *yin* and *yang* as correlatives are not universal principles that define some essential feature of phenomena, but are explanatory categories that register a creative tension in specific differences and thus make the immediate concrete things of the world intelligible. It is only through a process of generalization that feminine and male gender traits are construed as predominantly *yin* and *yang* respectively, and vocabulary such as vaginal orifice (*yinmen*) and virility (*yangdao*) emerges to essentialize the *yin* and *yang* contrast.

The *yin–yang* vocabulary is functional. In order to evaluate the propensity of a situation and manipulate it in advance, we must make distinctions. This is where the vocabulary of *yin* and *yang* comes into play. We begin from the assumed

uniqueness of each situation and the uniqueness of the components that constitute it. The *yin–yang* contrast provides a line, enabling us to divide a continuous situation into distinct yet interdependent particulars. *Yin* is a becoming-*yang*; *yang* is a becoming-*yin*. We must come to know the particular conditions that govern a situation so that we can manipulate them to advantage. This requires that one translate the situation into the *yin–yang* vocabulary of complementary opposites: strong–weak, fast–slow, many–few, regular–irregular and so on. *Yin–yang* is a vocabulary that enables us to discriminate among the many factors which together constitute the force of circumstances, and that allows us to control this force through the strategic adjustments. Once we have arrived at an understanding of the circumstances, we must identify those critical factors which will enable us to turn the configuration of an unfolding situation into an opportunity.

ZENO OF CITIUM (334–262 BC)

Zeno of Citium, a Greek philosopher from Cyprus, founded the Stoic school in Athens *c.*300 BC. His background and training lay in various branches of the Socratic tradition, including the Platonic Academy, but especially Cynicism. His controversial *Republic* was a utopian treatise, founded on the abolition of most civic norms and institutions. He laid the main foundations of Stoic doctrine in all areas except perhaps logic.

DAVID SEDLEY

ZENO OF ELEA (*fl. c.*450 BC)

The Greek philosopher Zeno of Elea was celebrated for his paradoxes. Aristotle called him the 'founder of dialectic'. He wrote in order to defend the Eleatic metaphysics of his fellow citizen and friend Parmenides, according to whom reality is single, changeless and homogeneous. Zeno's strength was the production of intriguing arguments which seem to show that apparently straightforward features of the world – most notably plurality and motion – are riddled with contradiction. At the very least he succeeded in establishing that hard thought is required to make sense of plurality and motion. His paradoxes stimulated the atomists, Aristotle and numerous philosophers since to reflect on unity, infinity, continuity and the structure of space and time. Although Zeno wrote a book full of arguments, very few of his actual words have survived. Secondary reports (some from Plato and Aristotle) probably preserve accurately the essence of Zeno's arguments. Even so, we know only a fraction of the total.

According to Plato the arguments in Zeno's book were of this form: if there are many things, then the same things are both F and not-F; since the same things cannot be both F and not-F, there cannot be many things. Two instances of this form have been preserved: if there were many things, then the same things would be both limited and unlimited; and the same things would be both large (that is, of infinite size) and small (that is, of no size). Quite how the components of these arguments work is not clear. Things are limited (in number), Zeno says, because they are just so many, rather than more or less, while they are unlimited (in number) because any two of them must have a third between them, which separates them and makes them two. Things are of infinite size because anything that exists must have some size: yet anything that has size is divisible into parts which themselves have some size, so that each and every thing will contain an infinite number of extended parts. On the other hand, each thing has no size: for if there are to be many things there have to be some things which are single, unitary things, and these will have no size since anything with size would be a collection of parts.

Zeno's arguments concerning motion have a different form. Aristotle reports four arguments. According to the Dichotomy, motion is impossible because in order to cover any distance it is necessary first to cover half the distance, then half the remainder, and so on without limit. The Achilles is a variant of this: the speedy Achilles will never overtake a tortoise once he has allowed it a head start because Achilles has an endless series of tasks to perform, and each time Achilles sets off to catch up with the tortoise it will turn out that, by the time Achilles arrives at where the tortoise was when he set off, the tortoise has moved on slightly. Another argument, the Arrow, purports to show that an arrow apparently in motion is in fact stationary at each instant of its 'flight', since at each instant it occupies a region of space equal in size to itself. The Moving Rows describes three rows (or streams) of equal-sized bodies, one stationary and the other two moving at equal speeds in opposite directions. If each body is one metre long, then the time taken for a body to cover two metres equals the time taken for it to cover four metres (since a moving body will pass two stationary bodies while passing

four bodies moving in the opposite direction), and that might be thought impossible.

Zeno's arguments must be resolvable, since the world obviously does contain a plurality of things in motion. There is little agreement, however, on how they should be resolved. Some points can be identified which may have misled Zeno. It is not true, for example, that the sum of an infinite collection of parts, each of which has size, must itself be of an infinite size (it will be false if the parts are of proportionally decreasing size); and something in motion will pass stationary bodies and moving bodies at different velocities. In many other cases, however, there is no general agreement as to the fallacy, if any exists, of Zeno's argument.

ZOROASTRIANISM

Zarathushtra, better known to the Classical and modern world in the Greek form of his name 'Zoroaster', revealed his vision of truth, wisdom and justice in the verse texts known as the *Gāthās* (*c.*1200–1000 BC) and is revered by Zoroastrians as their holy prophet. The religion is correctly described as *mazdāyasna*, 'the worship of Ahura ('Lord') Mazdā, creator of the world and source of all goodness. Since the Avestan word *mazdā* means 'wise, wisdom', Zoroastrians see their prophet as the original *philosophos*, 'lover of wisdom'. Zarathushtra's message is primarily ethical and rationalistic. Zoroastrianism teaches a life based on (1) the avoidance of evil, through rigorous discrimination between good and evil, and (2) the service of wisdom through the cherishing of seven ideals. These latter are personified as seven immortal, beneficent spirits: Ahura Mazdā himself, conceived as the creative 'holy' spirit; Sublime Truth; Virtuous Power; Good Purpose/Mind; Beneficent Piety; Wholeness/Health; and, finally, Immortality. Evil originates neither from God nor from his creatures, but from a wholly other source, personified as Angra Mainyu, the 'Hostile Spirit', whose existence is ritually and doctrinally rejected as being pretended and parasitic. Real existence is solely the domain of Ahura Mazdā and his creation; Angra Mainyu and his demons are actually states of negativity, denial or, as the religion puts it, 'the Lie'. Thus the charge that the religion is ontologically dualistic is no more true than it is of other systems which conceive of good and evil as being in fundamental opposition. Equally, the allegation that its theology is ditheistic or polytheistic is a misunderstanding of the Zoroastrian theological and ritual tradition. The influence which this religion has exerted on classical philosophy and the thought and practice of Judaism, Christianity and Islam is being reappraised by scholars in modern times.
